SPROCKETS AND PLATEWHEELS DESIGNED FOR ROLLER CHAINS

The range of sprockets and wheels designed for chains manufactured by our Company provides an all-round solution to the needs of industry in the sector of flexible mechanical transmissions and is the result of a manufacturing process that is designed to achieve the top in terms of technical and quality performance.

Our production programme includes sprockets and wheels designed for chains, produced in compliance with the principles and with the most recent Standards and International Unified Standards: UNI, ISO, DIN, ANSI, etc.

However, the standards define a profile with minimum dimensions and a profile with maximum dimensions for the wheel space for chains and rollers and the actual profile must lie within these values. There is the option of selecting proportioning criteria for the profile, since the tolerances that the Standards leave to the manufacturer's discretion are quite wide. The profiles can be optimised in terms of smooth transmission and the tooth's capacity to support greater stresses. This has led to the systematic development of a series of standardised profiles for which the geometry can be reproduced with great precision by tools designed specifically by computer and the reference profile of which is protected by the Company's know-how. A valued feature of this optimised profile, which is a characteristic exclusive to **CHIARAVALLI Trasmissioni spa**, is that of enhancing the "polygonal" chain wrap-around on the sprocket and on the platewheel, reproducing the motion discontinuity which is achieved even in the case of unfavourable transmission ratios and centre distances. As a result of this **CHIARAVALLI Trasmissioni spa** has been able to include sprockets with a very low number of teeth in its catalogue and production programme.

Respecting precision with limited machining errors is beneficial, even if the toothed wheel-chain set represents a somewhat "basic" transmission solution. This precision is assured by the systematic use of CNC machines and technologies developed to minimise the shearing stress and to improve the degree of surface finish. The sprockets and wheels designed for chains included in the catalogue are also manufactured in the version with the "Taper-lock" taper bush piece system particularly favoured in applications that require easy assembly and very precise centring tolerances.

Our sales programme is completed with single and multiple roller chains, and special chains suitable for every industrial application and **CHIARAVALLI Trasmissioni spa** is also able to manufacture sprockets and platewheels suitable for chains in a specific execution, produced to drawing any of material and with induction hardening and case-hardening and hardening applied to steel wheels and sprockets.

Our chain tensioning sprockets are supplied complete with bearing, ready for assembly in special tension or transmission points. The accurate machining and stable assembly on a dual protective shield ball bearing ensure greater resistance to loads and wear. The central elongated ring of the bearing facilitates assembly on special machines of every type.

Idler Sprockets with ball bearing

POLYETHYLENE CHAIN GUIDE RAILS

Material: PE-UHMW

High molecular weight polyethylene (Mol. weight higher than 1,000,000).

Colour: green - standard length 2 m. - 3 - 4 m. on request

Specific weight: 0.945 g/cm³.

Dynamic friction coefficient: 0.2 (P = 0.05 N/mm² - V = 0.6 m/s - T = 40°C).

Operating temperature: -200°C ÷ 60°C. For short periods by contact: 80°C.

Linear thermal expansion: 2 mm every 10°C starting from a room temperature of 20°C.

Metal Supports

(*) Available in galvanised sheet metal - and in AISI 304 stainless steel

NB. Profiles based on the Customer's drawings are produced on request.

STRAIGHT SPUR GEARS AND RACKS

Straight gears and racks are the classical components for mechanical transmission of rotary and transverse movements between moving parts of machines.

This explains why these components are so widespread and are used to such a large extent in various sectors of general mechanics such that in practice it is impossible to find a rigid type power transfer drive chain which does not adopt these basic components.

However, the needs of industry are extremely complex as regards the performance required from the gear and the rack and reflect the typical operating conditions in terms of precision or resistance of final use for which the gear and the rack are designed. This is why proposing a product intended to meet any need expressed by industrial experience would be unthinkable.

CHIARAVALLI Trasmissioni has made a basic choice with this aspect in mind, deciding to offer industry a broad range of gears and racks for general use, combined in a standardised series, which is characterised by excellent quality.

The gears and racks produced using standardised C40 steel are manufactured adopting modular sizes in accordance with a reference profile that complies with DIN 3972 II and a full head radius. This ensures complete engagement at the base of the tooth with an obvious increase in the bending resistance.

The internal specifications that define the geometry of the tooth prescribe a marked "K" profile for the side surface, with a strict limitation of the profile errors to negative deviations. This has a positive influence on the level of noise of the toothed pair, since the engaging impacts to the teeth head are reduced.

The systematic use of latest generation CNC gear hobbing machines, special hobs designed for very high cutting speeds and specifically developed processing technologies, enable a general precision to be assured in compliance with DIN 3962 Standards and a degree of surface finish that is not readily achieved with operations using a hob gear cutting machine.

The working tolerance for tooth thickness has been chosen to comply with the "cd 25" Coupling Category in accordance with DIN 3967 Standards, which defines the position and the size of the tolerance range and therefore the coupling gap between the gears.

A processing tolerance equal to "js 8" for the centre distance is recommended in compliance with DIN 3964 Standards for normal operating conditions, which if adopted, enables us to assure a minimum working coupling gap of adequate size, while at the same time limiting the value of the maximum gap. Similar considerations apply in the case of the gear-rack coupling, since the latter is manufactured adopting the same coupling cate-

gory.

Our Technical Department is available and willing to recommend the most appropriate assembly tolerances to Customers who are interested, although we are also able to manufacture gears with coupling gaps that are larger or smaller compared with the standard value to meet specific needs.

We are able to manufacture our straight gears as illustrated in the catalogue with a lengthwise crowning of the teeth, at the request of customers. This solution is particularly useful if the user is unable to ensure a perfect alignment between the axles.

THE RANGE OF MACHINES USED, COMPRISING ALMOST ENTIRELY OF VERY MODERN MACHINES THAT HAVE CUTTING EDGE FEATURES AND DESIGN ENABLES OUR COMPANY TO PRODUCE GEARS BASED ON A DRAWING IN QUALITATIVE AT A VERY COMPETITIVE PRICE.

Our Technical Department is available to carry out a preliminary examination of any processing problems experienced by Customers and to prepare cost estimates.

N.B. We manufacture racks from M7 to M16, on request.

BEVEL GEARS

The range of bevel gear showed in the catalogue is a selection structured according to transmission module and ratio, which is designed to meet the needs of general plant engineering and general mechanics to transmit motion among concurrent axes.

As such the range does not claim to guarantee particularly heavy-duty performance or to cater for ratio ranges that extend to cover every need.

The external configuration of the bevel gear complies with the sizing criteria as established by the DIN 3971 Standards, while the tooth geometry, corrected by displacing the profiles and by varying the taper, is a specific solution exclusive to **CHIARAVALLI Trasmissioni**.

This solution, provides special advantages since:

- the coupling conditions between the pinion and the ring gear are improved;
- a smoother motion transmission is assured;
- tooth resistance is increased;
- the undercut effect on the pinion is avoided, even in the case of high transmission ratios and pinions with a limited number of teeth.

Since these refer to a selection of gears intended to be used in a broad range of applications, **CHIARAVALLI Trasmissioni**, continuing a tradition that has now become firmly established, has defined a standardised tolerance category for the processing of the Company's range of bevel gear, which means that there is a controlled gearing gap between the wheels.

The requirements detailed in the DIN 3967 Standards adapted to the virtual teeth profile of the bevel gear and the recommendations of the DIN 3964 Standards to calculate the corresponding axial displacements for the assembly distances have been used for this purpose.

We are therefore in a position to provide the end user precise information regarding the tolerances to be adopted to define shaving adjustments to a given clearance, in accordance with the values detailed in the dimensional tables.

All the bevel gears manufactured by **CHIARAVALLI Trasmissioni** will be produced in accordance with the profile envelope procedure on modern gear cutting machines, which enables **CHIARAVALLI Trasmissioni** to ensure a satisfactory quality level thanks to the systematic checking of processing tolerances.

For this technological sector too, the equipment and the range of machines available to **CHIARAVALLI Trasmissioni** enables the Company to produce bevel gears based on a drawing and in accordance with the Customer's specifications.

BEVEL GEARS FOR TRANSMISSIONS BETWEEN ORTHOGONAL AXES

DECLARATION OF INTENT

The **change project** of this range of bevel gears has been developed with the intention of standardising the execution of this product and reducing the number of articles carried in the catalogue.

The key aspects of the project to which we intend to draw the attention of users can be specified as follows:

- Deletion of the "special" execution bevel gears and adoption of a single execution with harmonised sizing criteria.
- Adoption of the DIN 3971 Standards to size the tooth profile and the external body of the gears.
- Systematic correction of teeth by profile displacement to eliminate the undercut effect on the pinions, to improve the slip and the specific pressure and to obtain a tooth that is better able to withstand bending stresses.
- Selection of a standardised external configuration in terms of the front embedding on the bevel gears which will be implemented only from a given module.
- Generalised increase of the surface width to achieve higher load-bearing capacities.
- Selection of the ratios and the number of teeth based solely on the normal number of the R20 range in compliance with the UNI 2016 and the DIN 323 Standards, as well as the ISO R3 and ISO R17 recommendations, with the following progressions:

Ratio	1:1 = 16 - 18 - 20 - 22 - 25 - 28 - 32
	1:2 = 16/32
	1:3 = 16/48
	1:4 = 16/64

This initiative comes within the framework of a broader critical review of the Company's products, and CHIARAVALLI Trasmissioni spa intends to implement a form of technical collaboration with customers and will take due consideration of technical advice, suggestions and assessments for which CHIARAVALLI Trasmissioni spa thanks you in advance.

BEVEL GEARS FOR TRANSMISSIONS BETWEEN ORTHOGONAL AXES

Straight teeth Bevel Gears sized in compliance with DIN 3971

Corrected toothing by profile displacement and length-wise crowning of the tooth

Pressure angle: 20°

Gear ratio = 1:1

MATERIAL: C 43 STEEL – UNI 7847

LOAD-BEARING CAPACITY OF BEVEL GEARS

DESIGNED FOR TRANSMISSION BETWEEN ORTHOGONAL AXES

The mechanical performance or the load-bearing capacity of bevel gears is defined by the twisting moments that the gears are capable of transmitting:

- in the form of dynamic torque, when in motion;
- in the form of static torque, when stationary or moving slowly.

The dynamic torque (M_d) represents the limiting torque yielding due to bending fatigue, whereas the static torque (M_s) indicates the limiting torque at failure by yielding due to tooth bending.

The values declared for both torques are the maximum permitted values and have been tested in compliance with the calculation codes and based on the limiting stress values detailed in the DIN 3991 STANDARDS method C.

The test calculations are valid for a Service Factor (SF) equal to 1 in the absence of data regarding the real operating conditions. **We recommend adopting a safety factor equal to at least 1.5 to adjust the nominal torque to the operating torque.**

LOAD-BEARING CAPACITY OF BEVEL GEARS FOR TRANSMISSIONS BETWEEN ORTHOGONAL AXES

LOAD-BEARING CAPACITY OF BEVEL GEARS FOR TRANSMISSIONS BETWEEN ORTHOGONAL AXES WITH SPIRAL TOOTHING

The "GLEASON" system range of bevel gears with spiral tothing is an extension of the range of standard bevel gear pairs with which this range shares the declared intentions and objectives.

The criteria adopted comply as closely as possible with International Standards as regards general sizing and the definition of the geometric features, whereas the choice of the key nominal data has been based on a progression depending on the range of the normal numbers established by the DIN 323 and ISO R3/R17 standards.

The spiral tothing complying with the "GLEASON" system is the result of a specific project designed to achieve optimised functional features compared with the geometric parameters that frequently conflict with each other.

The key sizing for the tothing, in particular refers to the following:

- The choice of a reduced tooth height - Correction by profile displacement - Adoption of a normal pressure angle:

$\alpha_n = 20^\circ$ - The constant tooth bottom gap along the whole tooth surface and other geometric solutions. This series of bevel gear with spiral tothing is designed for general use in plants and in general mechanical applications. The project has been designed therefore, to privilege the mechanical performance normally requested by this sector and special attention has been paid in defining the geometric features that can determine the tooth covering factor and the restraining reactions which determine the load on the bevel gear pair bearings.

By their very nature bevel gears with spiral tothing are designed for a more demanding use compared with that of straight teeth bevel gear pairs therefore, CHIARAVALLI TRASMISSIONI has made available the Company's range of bevel gear pairs with the intention of providing a solution that will be appreciated by the users of this product.

Naturally and in the framework of the Company's traditional technical collaboration with end users, the CHIARAVALLI TRASMISSIONI technical office is available to provide suggestions concerning more specific circumstances and problems.

Directions and angles of forces acting on spiral bevel gears

Pinion with left-handed spiral as the drive wheel
Sprocket with right-handed spiral as the driven wheel

POLY – V GROOVED BELTS

Definition

A grooved belt refers to a flat belt made up to form a ring with internal length-wise grooves.

The flat section represents the reinforcing component and the length-wise ribs ensure adequate grip by fitting in the grooves of the corresponding pulleys.

CROSS-SECTION J				CROSS-SECTION L			
Belt type	Extension mm.	Belt type	Extension mm.	Belt type	Extension mm.	Belt type	Extension mm.

Nominal cross-sections and dimensions

Nominal width: $L = P \times N$

$P = P$ (Distance between pulley races)

$N =$ Number of grooves

Cross-sections	Pitch P = mm	Height A = mm
P J	2.34	3.60
P L	4.70	6.40

POLY – V TAPER-LOCK®

PULLEYS

Types

Grooved pulleys designed for industrial transmissions are identified by reference to the dimensions and the groove pitch in the following types: **PPV-J – PPV-L**

Profile dimensions

The transverse profile dimensions of a grooved pulley are shown in the figure and in the table.

TABLE

Type	PPV-J	PPV-L
Grooves pitch e	2.34	4.70
Tolerance for e^*	± 0.03	± 0.05
Sum of tolerances e^{**}	± 0.30	± 0.30
Race angle $\alpha^{**} \pm 0,5$	40°	40°
rt min.	0.20	0.40
rb max.	0.40	0.40
Diameter of the control sphere or roller $db \pm 0.01$	1.50	3.50
$2K^{**}$ nominal	0.23	2.36
f min.	1.8	3.3

* = this tolerance applies to the distance between the axes of two consecutive grooves

** = the sum of all the tolerances "e" for all the races of each pulley must not exceed the value foreseen in the table

* = the axis of each groove must form a $90^\circ \pm 0.5^\circ$ angle with the pulley axis

** = K is not in relation to the pulley's nominal diameter but is measured from the position of the measurement sphere or roller.

Pitch line diameter

The position of a grooved belt in contact with the corresponding pulley is shown in cross-section in the figure.

The real pitch line diameter d_p of a grooved pulley measured along the belt is slightly greater than the actual diameter d_e and the exact value depends on the type of belt used. For the purposes of illustration, the table shows the value b_e normally adopted to calculate the transmission ratio. In practice it is sufficient to use the actual diameter d_e to calculate the transmission ratio.

$$d_p \cong d_e + 2b_e$$

Type	PPV-J	PPV-L
$2 b_e$	2	5

Designation

The designation includes the following details, in the order given: the "pulley" domination, the reference of the current standard, the number of grooves, the type and the actual diameter expressed in millimetres.

An example of the designation for a PPV-J type grooved pulley designed for industrial transmissions with 8 grooves and an actual diameter of 200mm.: **8 PPV-J 200**.

Degree of finish of the grooves

The surface roughness of the grooves shall be **Ra 3.2** in compliance with ISO 254.

MATERIALS

C45 UNI 7845

Pulleys are manufactured in steel.

Balancing

UNI 4218 – ISO 1940

Pulleys prepared for a tapered bush are statically balanced within grade G.6.3.

It is possible to perform dynamic balancing, on request.

Dynamic balancing is essential for speeds exceeding 30 m/s.

Design power calculation

Make a note of the nominal power to be transmitted **P** (kw) (normally the nominal power of the electric motor), select the service factor **Co** based on the table and calculate the design power output **Pc** (kw) as follows: **Pc = Co x P**

Service factor (Co)

POWERGRIP® PULLEYS AND TOOTHED BELTS

FOR SYNCHRONOUS DRIVES

Toothed belts and pulleys are of major importance in synchronous drives based on flexible components. These components enable problems to be overcome efficiently and very economically, problems that would otherwise require the use of kinematic motion gearing or transmissions with articulated link chains.

In fact, the performance provided by synchronous belt drives is analogous to the characteristic performance of both chains and gearing however belts and pulleys by comparison have additional advantages deriving from their structural features.

This evident versatility in application is essentially due to the operating characteristics that are common to all toothed belt synchronous drives, and they can be summarised as follows:

- Transmission of absolute asynchronous motion due to the complete absence of slipping.
- Regular and constant motion, since the toothed belt is free from polygonal winding and the consequent speed variation typical of chain transmissions.
- Non-extendable belt that transmits the motion without significant stretching and therefore without lost motion.
- Moderate assembly pre-tension, since adhesion is not required between the belt and the pulley.
- Minimum radial load on the shafts and on the bearings.
- High capacity to transmit power and high torques at low speed.
- Silent running, good performance, minimum overall dimensions and limited maintenance requirements.

The quality of synchronous transmission depends to an equal extent on the characteristics of both the belt and the pulley, which therefore must comply with demanding design and construction criteria.

CHIARAVALLI Trasmissioni spa avails of the technical collaboration of the most qualified manufacturers of belts worldwide and produces the Company's complete range of toothed pulleys in compliance with current Standards, but implementing a series of adjustments designed to improve the matching characteristics with the belt.

POWERGRIP® GATES® BELTS FOR TIMING BELT PULLEYS

Structural Features

The following components can be identified in the structure of the toothed belts:

- A - Reinforcing insert
- B - Polychloroprene belt body
- C - Teeth lining

N.B.

The MXL pitch bars are only manufactured in Aluminium suitable for hard anodising.
The XL - L bars are only manufactured in Steel and Aluminium suitable for hard anodising.

POWERGRIP® - HTD®

TOOTHED BELTS

The HTD® toothed belts are produced with the following pitches: 3mm., 5mm., 8mm., 14mm. and 20mm.

The 3mm., 5mm., 8mm. and 14mm. pitches are marketed by **CHIARAVALLI Trasmissioni S.p.A.** in a wide range of lengths and widths.

The main belt dimensions are as follows:

PITCH LINE LENGTH - PITCH - WIDTH

The product of the pitch by the number of teeth of a given belt corresponds to the belt's pitch line length.

The belt pitch is given by the distance between the axes of two adjacent teeth, in mm., measured along the belt's pitch line.

The theoretical pitch line of a HTD® belt is positioned halfway along the reinforcing inserts.

Belt characteristics

Belt identification

Pitch line extension

Pitch in mm.

Belt width

1040 - 8M - 50

HTD® 3M

HTD® 8M

HTD® 5M

HTD® 14M

Belt tolerances along the pitch line length are limited, to achieve the correct belt tension therefore, it is necessary to be able to adjust the centres distance or tension the belt using a tensioning roller.

CHIARAVALLI Trasmissioni S.p.A. manufactures the HTD® pulleys in the following pitches: 3mm., 5mm., 8mm. and 14mm. and in the following versions:

- a) HTD® Pilot Bore pulleys
- b) HTD® with Taper-Lock taper bush

Belt identification:

30 No. of teeth
14M pitch in mm.
55 belt width

PULLEY BALANCING VALUES

The HTD® pulleys manufactured by our company are not balanced. Balancing is performed at cost, only on request.

We are able to balance pulleys up to a maximum diameter of 560 mm. and issue the relative certificate.

PULLEY DIAMETERS	SURFACE WIDTH	MAXIMUM UNBALANCE IN GRAMS
from 199 - 301	60	6
from 302 - 599	60	10
from 199 - 301	from 60 - 99	10
from 302 - 599		15
from 600 - 999		20
greater than 1000		30

Material: Steel C 40 UNI 7845

POWERGRIP® - GT® BELTS

The POWERGRIP® - GT® range of belts represents the natural development of the HTD® curved profile belts.

The use of new materials has enabled better performance to be achieved, new production technologies ensure consistent optimum quality, new profiles ensure greater precision and silent operation.

The POWERGRIP® - GT® range of belts can only operate in pulleys that have their specific profile.

These pulleys are manufactured having the following pitches: 2 - 3 - 5 mm; **CHIARAVALLI Trasmissioni S.p.A.** produce bars and pulleys having the following pitches: 3 and 5mm.

The applications of the POWERGRIP® - GT® range of belts are virtually unlimited but they are mainly recommended for the following:

- good power transmission in limited spaces - for example: electrical household appliances
- silent operation - for example: various office machines
- consistent precision - for example: machine tools and robots

Belt characteristics

GT® 3MR

GT® 5MR

POWERGRIP® GT® "GATES®" BELTS

Belt tolerances along the pitch line length are limited, to achieve the correct belt tension therefore, it is necessary to be able to adjust the centres distance or tension the belt using a tensioning roller.

N.B. The GT® - 3MR GT® - 5MR bars are only manufactured in Aluminium suitable for hard anodising. Available till sold out.

"GATES"[®] POLY CHAIN[®]

GT2 BELTS

The **POLY CHAIN[®] GT2** synchronous belts represent the most recent development of the "GATES"[®] range and provide excellent performance on industrial drives with high torque and low speed. The belt's reverse surface and the teeth are made using a polyurethane mix and ensure special adhesion to the drive body. This particular type of polyurethane renders the belt resistant and virtually immune to abrasion and attack by chemical agents. The aramide strands give the belt extraordinary transmission capacity and excellent resistance to wear.

The belts have a very long useful working life and operate perfectly at temperatures lying between -54°C and + 85°C.

Both the belts and the pulleys are manufactured with the following pitches: 8mm - 8MGT and 14mm - 14 MGT.

PITCH SELECTION FOR "T" BELT

" T " P U L L E Y S

EXECUTION 0F

EXECUTION 1F

EXECUTION 2

How to identify a pulley – Example: 31 T10 25

Pulley width (mm) 31

Pulley pitch (mm) T10

No. of teeth on pulley 25

material: ALUMINIUM

T20 pitch pulleys and bars are manufactured on request.

T 2.5 (2.5 mm pitch) DESIGNED FOR 6 mm WIDE BELTS

"CT" PULLEYS DESIGNED FOR "AT" BELTS

Dimensional features

- P = Pitch
- Z = No. of teeth
- \varnothing_p = Pitch line diameter
- \varnothing_e = External diameter
- Lp = Pulley width
- Lc = Belt width
- Lpc = Belt pitch line length

Belt identification

- 16 AT10 440 {
- 16 = Belt width in mm.
 - AT10 = Toothing pitch in mm.
 - 440 = Pitch line length in mm.

- A) Polyurethane belt body
- B) Steel reinforcing insert

N.B. The "AT" profile represents an optimised version of the 'T' metric pitch, ensures enhanced belt meshing with subsequent reduced noise levels, the power transmitted is greater than ~ 30% compared with the 'T' version.

Fields of application:

machine tools, electrical household appliances, textile machines, packing machines, typewriters, sewing machines, etc.

"AT" "MECTROL"® POLYURETHANE BELTS

COMPACT DRIVE APPLICATIONS POLYFLEX V-BELTS

POLYURETHANE POLIFLEX® V-BELTS

This strong and compact V-belt is available in several nominal width dimensions **3-5-7-11 M** (mm) and it gives high speed applications higher power and precision. Poliflex is especially designed to fit very small diameters and ultra-compact transmissions with high speed rotation. It is well indicated for machine tools and high performance units, which require continuous operating in little space, such as milling machines, turning lathe, wood and metal processing units.

COMPACT DRIVE APPLICATIONS POLYFLEX JB V-BELTS

POLYURETHANE POLIFLEX® MULTIPLE V-BELTS

Poliflex JB V-belt is a very high and uniform powered belt used in little space. Poliflex JB V-belt allow to small high precision transmissions, which use multiple belts, bigger load and higher speed. It is the perfect solution for all machine tools and small compressors.

Not available on stock, only upon request

CLAMPING PLATES

Anchoring belts by using clamping plates enables the rotary motion of the pulleys to be translated into a linear motion of boards or other particularly suitable devices to clamp the belts lengthwise.

CLAMPING ELEMENTS

The clamping system connects one or two component parts solidly to the drive shaft, which allow motion to be transmitted or to withstand an axial thrust. Friction connection enables gaps to be eliminated, thereby ensuring greater precision of the keyed components without requiring strict processing tolerances. The thrust cones develop a pressure between the shaft and the hub, which enables pulleys, gears, chain sprockets, drums, flywheels, etc. to be anchored securely. The easy assembly and disassembly features give users many advantages leading to a further cost saving.

Chiaravalli Trasmissioni S.p.A. provides its Customers with different types of clamping elements, which are designed to cover a broad range of applications.

SELF-CENTRING RCK 15 TYPE

Suitable for assemblies where axial and radial positioning accuracy is required with medium-high torque values. The main feature is the possibility of varying the internal bores while maintaining the external dimensions constant at only three diameters.

SELF-CENTRING RCK 13 TYPE

Suitable for assemblies where good concentricity is required in small spaces with medium-high torque values. Can substitute RCK 40 in some cases.

SELF-CENTRING RCK 16 TYPE

Suitable for assemblies where concentricity and positioning accuracy is required. Operates with medium-high torque values.

SELF-CENTRING RCK 70/71 TYPE (RCK 70 WITH SPACER)

The RCK 70 version is suitable for assemblies where concentricity and orthogonal positioning of the parts is required.

The RCK 71 version has the same features as RCK 70 with the addition of a spacer ring to completely avoid possible axial displacements.

These components operate with medium-high torque values.

SELF-CENTRING RCK 80 TYPE

Suitable for assemblies on hubs with thin walls guarantees both axial and radial positioning precision with medium transmission torque values.

SELF-CENTRING RCK 11 TYPE

Suitable for assemblies where special, even heavy-duty conditions are required, achieving maximum friction clamping results. Incorporates the best features of all the models presented. Operates with very high torque values.

SELF-CENTRING RCK 55 TYPE

Suitable for assemblies where limited overall dimensions and times are required. Operates with medium-low torque values.

SELF-CENTRING RCK 60 TYPE

Suitable for assemblies where a medium-high twisting moment is required. Operates in the opposite mode to RCK 13.

SELF-CENTRING RCK 61 TYPE

Enables adjacent components to be clamped to the hub thanks to an axial force achieved during the clamping phase.
Operates with medium torque values.

RCK 40 TYPE

Suitable for general applications, is not self-centring and therefore requires a centring band to ensure perfect concentricity.
Operates with medium-high torque values.

RCK 50 TYPE

Comprising two tapered rings, must always be mounted with a tightening flange.
Operates with low torque values; not self-centring.

RCK 19 TYPE

Suitable for hollow shafts, operates by compressing the hollow shafts on the solid shaft enabling transmission of medium-high twisting moments to be achieved.

RCK 95 TYPE

Enables rigid connection between two aligned shafts. Transmits medium-high twisting moments with the advantage of enabling rapid assembly and disassembly.

RCK 45 TYPE

Suitable for applications where medium-low twisting moments are required, with easy rapid assembly and disassembly. Not self-centring.

SELF-CENTRING TYPE CLAMPING

RCK 15 ELEMENTS

N.B. The recommended machining tolerances for the pressure surfaces are as follows:

h8 for Shaft

H8 for Hub

ORDERING EXAMPLE:

The following will be ordered with a shaft having $\varnothing d$ 40 with a torque value less than or equal to 1.030 Nm: **RCK 15 - 40x65.**

RCK 15

CLAMPING ELEMENTS

Checking minimum hub diameter D_m

The minimum external hub diameter (D_m) must be checked after the type of clamping element with the required features has been selected, since the hub must withstand the stresses produced by the high pressures developed by the clamping element.

The check is merely static and only refers to the stresses generated by the clamping element:

$$D_m \geq D \times \sqrt{\frac{R_{s\ 0.2} + (P_m \times C)}{R_{s\ 0.2} - (P_m \times C)}}$$

- Dove:
- D_m = external hub diameter (mm)
 - D = external diameter of clamping element (mm)
 - $R_{s\ 0.2}$ = yield strength for a permanent elongation of 0.2% (N/mm²)
 - P_m = specific pressure exerted on the hub by the clamping element (N/mm²)
 - C = Utilisation coefficient depending on the hub profile (refer to the figures below).

$C = 1$

$C = 0.8$

$C = 0.6$

"GIFLEX®" GE-T COUPLINGS with FLEXIBLE SPIDER

TORSIONAL FLEXIBLE COUPLINGS PRECISE EXECUTION

INTRODUCTION

Flexible torsion couplings, which are connecting devices between rotating shafts, are designed to ensure shock-free torque transmission and to compensate minor alignment deviations in operation between the shafts in industrial use.

The GE-T range of flexible couplings ensures this level of performance and also provides excellent quality thanks to the machining accuracy and the choice of the materials used.

The general level of reliability provided by the GE-T couplings is ensured by a satisfactory useful working life of the couplings.

GENERAL

The GE-T range of flexible couplings represents torsionally flexible, mechanical couplings capable of transmitting a twisting moment proportional to the flexible yield of the intermediate component.

The couplings must also be capable of effectively absorbing possible torsional vibrations due to the load or self-induced, to attenuate impacts and torque peaks during the start-up phase and to compensate minor angular and parallel misalignments between the shafts, however ensuring an acceptable useful working life.

These features and more in general the performance required from the coupling depend almost exclusively on the quality of the intermediate component. The choice of the material used to manufacture the coupling is therefore fundamental. The curve that expresses the flexible characteristic of the intermediate component must have a progressive trend (yielding at low torque values and remaining rigid at higher torque values) to ensure operation without jerks at start-up and with a limited torsional yield at steady state conditions.

It is essential for the intermediate component to have a certain flexible hysteresis, proportional to the required absorbing effect that ensures the coupling can effi-

ciently absorb possible torsional oscillations. Furthermore, the useful working life of the coupling depends on the flexible yield of the material comprising the intermediary component. The physical characteristics as described above are frequently in contrast with each other and compared with other basic mechanical and technological parameters. The performance of the intermediary component therefore cannot be adapted to the variety of operating conditions when only one type of material is used and therefore the materials adopted for the flexible ring gear must be differentiated. A selected thermoplastic elastomer is selected to meet medium level needs in the basic execution. This refers to an elastomer with medium rigidity, characterised by an optimum internal dampening effect, resistant to ageing, to fatigue, to abrasion, as well as hydrolysis and to the principal chemical agents with special reference to oils and ozone. Operating temperatures lying between -40°C and $+125^{\circ}\text{C}$ with brief peaks of up to 150°C are permitted in the case of couplings in the base execution. Alternative mixes capable of meeting every practical need have been designed and are available on request for use in extremely demanding operating conditions, or for needs that exceed average requirements.

OPERATING AND ASSEMBLY CONDITIONS

Operation of the flexible torsion couplings, such as the GE-T type or similar couplings is characterised by a proportional feature between the twisting torque and the torsion angle and by the ability to compensate limited angular and radial misalignments.

Key features of equal importance, but which are more difficult to interpret are represented by the absorbing factor and the natural frequency or resonance. To qualify its couplings, **CHIARAVALLI Trasmissioni spa** declares permitted twisting torque values correlated to well defined torsion angle values, which has the limiting value of 5° corresponding to the maximum torque value. This provides a valid guide for the progressive characteristic of the flexible curve. The maximum permitted values are shown in the case of the angular and radial misalignments, with the warning that these refer to extreme values that cannot be added together (only angular compensation or only radial compensation) and apply to "standard" operating conditions characterised by the following: operating torque not exceeding the nominal torque, a rotating speed of less than 1,450 r.p.m and coupling temperature not exceeding 40°C . The maximum rotating speed expressed in r.p.m. that corresponds to a maximum peripheral speed of 30 m/sec. is indicated for each coupling of the GE-T range. This speed can be achieved with a sufficient safety margin compared to the danger of failure due to centrifugal force stress thanks to the characteristics of the material used. Class G 2.5 dynamic balancing in compliance with ISO

1940 is recommended despite the fact that the half-couplings are fully machined on both external surfaces, if the actual operating speed exceeds 2.800 r.p.m.

COUPLING SELECTION AND SIZING CRITERIA

Couplings are sized on the basis of the physical laws of mechanics and the resistance of the materials and also complies with the provisions established in the DIN 740 standards Sheet 2.

The coupling is selected on the basis of the criteria, which establishes that the maximum permitted stress is never exceeded even in the most demanding operating conditions. It follows that the nominal torque declared for the coupling must be compared with a reference torque that takes into account the overloads due to the way the load is exerted and the operating conditions. The reference torque is obtained by multiplying the operating torque by a series of multiplying factors depending on the nature of the load or on the ambient temperature conditions.

Symbols:	TKN	= coupling maximum torque (Nm)	
	TK max	= coupling maximum torque (Nm)	
	TKw	= torque with coupling inversion (Nm)	
	TLN	= driven side operating torque (Nm)	
	TLs	= driven side static torque (Nm)	
	TAs	= motor side static torque (Nm)	
	Ts	= plant static torque (Nm)	
	PLn	= driven side operating power (kW)	
	nLn	= driven side rotating speed (r.p.m.)	
	St	= temperature factor	
	SA	= motor side impact factor	
	SL	= driven side impact factor	
	Sz	= start-up factor	
	MA	= control side mass factor	$\frac{JL}{JA+JL}$
	ML	= driven side mass factor	$\frac{JA}{JA+JL}$

LOAD DUE TO NOMINAL TORQUE

The permitted nominal coupling torque TKN must apply for any operating temperature value equal to or greater than the driven side operating torque TLN.

$$TLN = 9549 \frac{(PLn)}{nLn} \text{ [Nm]}$$

The following condition must be satisfied, where St represents the temperature factor, to take into account overloads due to the operating temperature for the coupling.

$$TKN = > TLN * St$$

START-UP LOAD

The drive motor delivers a drive torque during the start-up transient period, which is a multiple of the nominal torque and depends on the way the masses are distributed. A similar situation occurs in the braking phase therefore, these two phases are characterised by torque impacts that have an intensity which depends on the distribution of the masses on the drive side MA and on the driven side ML, as well as the frequency of the number of start-ups on which the start-up factor Sz depends. The static torques for the drive side and the driven side are expressed by the following relationships:

- drive side $TS = TAS * MA * SA$
- driven side $TS = TLS * MM * SL$

MA and ML are assumed to be equal to 1, to a first approximation, and if the distribution of the masses is unknown. The SA factor can be assumed as being equal to the relationship between the start-up torque and the nominal torque in the case of drives based on an electric motor.

LOAD CAUSED BY TORQUE IMPACTS

The permitted nominal coupling torque TKN max must be equal to or greater than the start-up torque increased by the temperature factor and by St and by the start-up factor Sz for any operating temperature value.

$$TKN \max > TS * St * Sz$$

Consult the CHIARAVALLI Trasmissioni Technical Department for operating conditions that foresee periodic variations or torque inversions, as well as alternate torsional stresses.

INDICATIVE VALUES FOR ADJUSTMENT FACTORS:

NAME	SYMBOL	DEFINITION				
Temperature Factor	St.	St. °C	1	1.2	1.4	1.8
			-30	+40	+80	+120
Start-up Factor	Sz.	Number of start-ups per hour				
		Start-up/hr. Sz.	100	200	400	800
Impact Factor	SA/SL	SA/SL				
		Minor start-up impacts	1.5			
		Medium start-up impacts	1.8			
		Major start-up impacts	2.2			

SERVICE FACTORS

LOAD CONDITION	OPERATING CONDITIONS	TYPE OF DRIVE	
		Electric motor	Diesel engine
UNIFORM	Regular operation without impacts or overloads	1.25	1.5
LIGHT	Regular operation with minor and infrequent impacts and overloads	1.50	2.0
MEDIUM	Irregular operation with medium overloads for a short duration and frequent but moderate impacts	2.0	2.5
HEAVY	Markedly irregular operation with very frequent impacts and overloads and of major intensity.	2.5	3.0

"GIFLEX®" GE-T SG BACKLASH-FREE TORSIONAL COUPLING

INTRODUCTION

The aluminium flexible couplings GE-T SG are made of three pre-tensioned elements in backlash-free execution.

They are meant for the coupling mounting and they are designed to fit low torque working units and industrial processing, where they must satisfy certain requirements.

Thanks to their limited dimensions and their easy mounting, they can operate in little space and any project can take big advantages of it.

FEATURES

The buckle tightening guarantees a quick and sure fixing without extension between shaft and hub. It is however important to keep the screw tightening torque (MS) shown in the table.

Besides testing the size of the coupling given in the table, it is suggested to test the maximum torque of buckle to diameter (F).

The elastomeric element, that has a star shape, is set into the hubs' hollow seats with a light pre-tensioning, ensuring the needed transmission torque backlash-free execution.

TECHNICAL DATA (Polyurethane elastomeric element in blu colour 80 shore A - in yellow colour 92 shore A - in red colour 98 shore A).

"GIFLEX®" GF COUPLINGS with POLYAMIDE SLEEVE

DUAL CURVATURE FLEXIBLE TOOTHED COUPLINGS

PRESENTATION

The GIFLEX range of flexible toothed couplings are commercial couplings for general applications, which are however manufactured to a high quality standard and offer technical and performance features that are typical of industrial couplings.

The specific application sector refers to power transmissions for the flexible connection of rotating parts, with the possibility of compensating radial and angular misalignments and absorbing axial slippage.

The performance is in line with this class of couplings, rendered more demanding and better suited to the needs of industrial requirements by the design criteria adopted and the precision with which the couplings are machined and systematically tested.

CONSTRUCTION

In structural terms, the flexible toothed couplings consist of two symmetrical steel hubs and a synthetic resin sleeve, which ensures the coupling and power transmission between the two hubs.

The two hubs are manufactured from low carbon content steel and have been subjected to anti-corrosion surface treatment and are each fitted with a toothed ring.

The hollow sleeve with internal toothing formed by injection moulding comprises a high molecular weight semi-crystalline technical polymer, guaranteed by certification at origin, thermally conditioned and charged with a solid lubricant that contributes to enhance the self-lubricating features typical of the polymer. The toothing of the two hubs has a progressive dual curvature, produced using a Numerically Controlled machine tool, which ensures the coupling provides optimum performance. This solution enables dynamic type angular and radial misalignments to be compensated ALSO UNDER LOAD CONDITIONS. The specific geometry of the tooth for a given transmitted twisting moment significantly reduces the surface pressure, thereby increasing the coupling's capacity to

transmit the load and fatigue resistance.

The polymer's relative insensitivity to atmospheric humidity and its capacity to withstand temperatures between -20° and $+120^{\circ}$ with brief peaks of up to $+150^{\circ}$ enable the coupling to withstand demanding working conditions also in an aggressive environment.

CHARACTERISTICS

The couplings provide the following performance in practical applications:

- Reduced overall dimensions, weight and inertia moment;
- Constant velocity behaviour at speed;
- Silent operation and the ability to absorb impacts and vibrations flexibly;
- Withstand the most common aggressive chemical agents and moderate heat, max. temp. 80° ;
- Self-lubricating, electrically insulated and maintenance-free;
- Inexpensive, easily assembled and are suited to a variety of applications, also in demanding conditions.

"GIFLEX®" GF FLEXIBLE COUPLINGS

Code interpretation

Example:

GF - 14-NN = with 2 normal hubs

GF - 14-NL = with one normal hub and a long hub

GF - 14-LL = with 2 long hubs

DIMENSIONS

The coupling's characteristic size is defined by the maximum bore diameter.

(2) Per hub.

ASSEMBLY GUIDELINES

- Position the two semi-couplings on the shafts, taking care that the internal surfaces are in line with the shaft ends.
- Insert the sleeve on the two semi-couplings adjusting their distance (distance "G"), while the two shafts are aligned at the same time.
- Clamp the two parts to be coupled together in position.
- Check that the sleeve is free to move in an axial direction before the coupling is rotated.

"GIFLEX®" GFA-GFAS COUPLINGS with STEEL SLEEVE

DUAL CURVATURE, FLEXIBLE TOOTHED COUPLINGS

PRESENTATION

The "GIFLEX" GFA - GFAS range of flexible couplings represent couplings designed with a compact structure for industrial applications, torsionally rigid and capable of compensating angular, parallel and combined misalignments.

The special configuration with the single-piece sleeve and the seals at the two ends renders the couplings suitable for use in aggressive environments and in particularly demanding operating conditions. The performance complies with the characteristics of a dual articulation, constant-velocity coupling intended to be used both for general and specific applications and with the possibility of also being mounted on shafts with a large free gap.

The operating limits defined by the maximum torque, by the rotating speed and the permitted angular misalignment are the result of a design based on a targeted choice of materials, the heat treatment and the toothing geometry.

The reliability of the stated operating limits has been confirmed by testing the fatigue limits both at the surface pressure (Hertzian pressure) and at bending and to destructive wear in accordance with calculation schemes based on the most authoritative international standards.

The CHIARAVALLI Trasmissioni Technical Department is available however, to examine problems that relate to the choice, application and maintenance of couplings in collaboration with users.

**On specific request,
special couplings by**

their shape, execution and performance can be offered and produced, as an alternative to the normal execution couplings. For example:

- Couplings designed for high angular and parallel misalignments.
- Couplings manufactured using high resistance steel and with surface hardening heat treatment.
- Couplings with case hardened and hardened hubs and tothing finished by machine tools after heat treatment (skiving using a hard metal tool).
- Special couplings manufactured to a drawing.

STRUCTURAL CHARACTERISTICS

The **GFA** range of compact couplings, comprise two toothed hubs and an external connecting single-piece sleeve.

The lubricant seal inside the coupling is ensured by two ring gaskets, arranged at the two ends of the sleeve and held in position by spring washers (Seeger washers).

Two threaded dowels arranged radially on the sleeve in a counter-position allow a solid lubricant to be adopted.

The tothing adopted for the two hubs is profile corrected and has a progressive dual curvature achieved by machine the tothing on a fully Numerically Controlled gear cutting machine.

The sleeve's profile corrected tothing, which has a parallel generatrix, is obtained using a shaping tool.

The tothing is produced to category 7 precision, in compliance with DIN 3972 and has a degree of finish with a surface roughness of not more than $Ra = 1.4$ micrometres, thanks to the machining technology adopted.

Both the hubs and the sleeve are manufactured using hardened and tempered carbon steel with a tensile stress resistance of 800 N/mm. The couplings are subjected to a surface hardening thermo-chemical treatment at the end of the machining stage, which ensures a high resistance to wear and seizure and also confers a high resistance to corrosion caused by atmospheric agents.

The perfect seal achieved by the gaskets ensures the required lubricant containment and prevents penetration of contaminating elements from outside, thereby contributing to increase the average useful working life of the coupling, even if operating in an aggressive environment.

The two toothed hub bands are positioned at the maximum distance permitted by the sleeve length. This arrangement ensures a minimum angular misalignment for a given parallel misalignment and enhances the coupling's constant-velocity features.

COUPLING SELECTION AND SIZING CRITERIA

The satisfactory operation and the useful working life of flexible toothed couplings depends on the correct selection of the couplings, as well as on the compatibility of the operating conditions with the performance provided by the coupling.

It is essential therefore, to highlight the limiting performance of the couplings and to clarify the actions of the external loads that are exerted on the corresponding couplings.

The basic design ensures that all the couplings are capable of compensating a static angular or assembly misalignment equal to 1 degree and this is ensured by the minimum construction tolerance between the teeth.

The dynamic angular or operating misalignment must never be greater than 0.5 degrees, even if the recommended values should not be greater than 0.25 degrees.

The declared nominal torque values and the maximum rotating speeds indicated refer to an angular or composite misalignment that does not exceed 1/12 of a degree (5 prime divisions).

The 'exceptional' torque values that can be supported as a transient and during the acceleration phases must not be exerted for more than 10-15 seconds and must not occur for more than 5 events/hour.

Fatigue durations are calculated for a conventional limit of 50 million cycles, considering two load cycles for each revolution of the coupling.

Misalignments exceeding 1/8 degrees (7.5 prime divisions) penalise by decreasing the nominal torque and the maximum rotating speed declared for the individual couplings.

The performance of the coupling in terms of torque, limiting speed and useful working life will decrease or increase compared with the declared values in the case of operating conditions that differ from the conditions specified above or for "fixed-term" durations.

The design data has been tested for the purpose of ensuring a reasonable safety margin. The declared performance therefore, is to be understood as valid for a Service Factor equal to 1.

Use of the prescribed lubricants and compliance with the recommended restore time intervals represent the pre-conditions to achieve the performance as described in the catalogue.

The CHIARAVALLI Trasmissioni Technical Department is available to advise users in selecting the type of coupling most appropriate for the actual operating conditions and to make recommendations in relation to special operating conditions.

(1) Referred to the normal coupling complete with maximum bore without keyway.

N.B. Class G 2.5 dynamic balancing in compliance with ISO 1940 is recommended for actual operating speeds that exceed 3,600 r.p.m.

Couplings can operate with a parallel misalignment value that is double the suggested value and assembly with a misalignment value that is four times greater than the suggested value in exceptional cases.

COUPLING SIZE SELECTION INSTRUCTIONS

The torque, speed and useful working life data declared for the couplings are to be understood as valid referred to a Service Factor SF = 1.

The service factor must be determined therefore, based on the type of load, the load intensity and the range factor that characterises the type of load exerted on the coupling.

The values shown in the following table can be considered as a precautionary measure in the absence of reliable service factor design data.

It is appropriate to multiply the service factor taken from the table by an increasing factor equal to 1.4 in the case of continuously reversible operations under load.

LOAD CONDITION

SERVICE FACTORS

UNIFORM
LIGHT
MEDIUM
HEAVY

OPERATING CONDITIONS

Regular operation without impacts or overloads
 Regular operation with minor and infrequent impacts and overloads
 Irregular operation with medium overloads for a short duration and frequent but moderate impacts
 Markedly irregular operation with very frequent impacts and overloads and of major intensity.

TYPE OF DRIVE

Electric motor	Diesel engine
1.25	1.5
1.50	2.0
2.0	2.5
2.5	3.0

TEST BASED ON THE POWER TO BE TRANSMITTED

Use the following formula to calculate the value of the operating torque (M_e) expressed in Nm, considering the drive motor power output (P) in kW and the operating speed (n) in r.p.m.

$$M_e = \frac{9549 \times P}{n}$$

Establish the nominal torque to be transmitted (M_n) based on the service factor taken from the table.

$$M_n = M_e \times S_f$$

Select the coupling with a nominal torque which is GREATER than the value calculated.

WARNING

The declared nominal torques must be progressively decreased for angular misalignments that exceed 0.125 degrees.

TEST BASED ON THE SHAFT DIAMETER

Check that the largest of the shafts to be connected has a diameter equal to or less than the nominal bore declared for the coupling.

Adopting the maximum permitted diameter for the selected coupling should be limited to UNIFORM or LIGHT load conditions.

TEST BASED ON THE ROTATING SPEED

The maximum rotating speed indicated for each coupling represents an operating limit calculated for an angular misalignment that does not exceed 1/12 of a degree. Both the nominal torque and the permitted rotating speed are reduced for greater angular misalignments. Adopt a coefficient equal to 1.12 to increase the service factor and select the coupling as described previously when both the misalignment and the operating speed are less than the suggested reference values, but are close to these values. Contact our Technical Services for operating conditions with misalignments and operating speeds that exceed the suggested reference values.

TEST BASED ON THE REQUIRED USEFUL WORKING LIFE

Couplings are calculated for a standard operating lifespan under nominal operating conditions (torque, misalignment and rotating speed). Operating lifespans that exceed the standard duration cause the nominal torque to decrease.

The service factor must be multiplied by a lifespan coefficient defined as follows if a given operating lifespan, which exceeds the standard working lifespan, is required.

OPERATING LIFESPAN IN HOURS	3.800	4.000	6.000	8.000	12.000	20.000
LIFESPAN COEFFICIENT	1	1.06	1.17	1.26	1.39	1.58

The nominal torque verified for the lifespan must be further decreased in the fairly improbable circumstance in which the actual operating speed is greater than the maximum permitted operating speed for the misalignment conditions of the coupling when in operation.

ASSEMBLY INSTRUCTIONS

— GFA ASSEMBLY

- A) Insert the stop ring (4) and the seal ring (2) on the shaft.
- B) Assemble the hubs (2) on the relative shafts.
- C) Sleeve (1) is to be fitted on the longest shaft.
- D) Position the shafts close together and check that the distance G corresponds to the value indicated in the table.
- E) Align the shafts and check the parallelism then tighten the hubs on the shaft.
- F) Fill the tothing and the gap between the hubs with grease.
- G) At this stage slide the sleeve (1) down and position the sealing rings (3) in its place and tighten the stop rings (4) in their seat.
- H) Proceed as follows for disassembly: remove the stop rings (4) using a pair of pliers, separate the sleeve (1) from the hubs (2) and the GFA coupling is fully disassembled.

MAINTENANCE

Unscrew both plugs (5) then introduce grease using the grease gun through the greasing holes until the grease exits from the other hole positioned at 180°. Replace the plugs. Repeat this operation every 1.000 working hours.

— GFAS ASSEMBLY

- A) The seal ring (3) and stop ring (4) are already fitted on the extractable hub (2).
- B) Assembly in closed cone mode only requires the sleeve (1) to be fixed onto one shaft and the extractable hub (2) to be tightened on the other shaft.
- C) Then arrange the shafts to be connected closely together, positioning the hub (2) over the sleeve (1).
- D) To disassemble, separate the shafts then extract the hub (2) from the sleeve (1).

Couplings require lubrication with grease, the quantity of grease used should half fill the available gap.

Use of Lithium soap grease with a base mineral oil and consistency index 2 (in compliance with NLGI) is recommended for moderate loads and normal operating conditions.

Use Barium complex soap grease, PAO synthetic base oil and consistency index 2 for heavy-duty operating conditions as regards temperatures and with heavy loads.

Contact the CHIARAVALLI Trasmissioni spa Technical Department for extreme operating conditions.

The lubricant complying with the formulation and with the recommended characteristics can be selected from among the range of products indicated below by consulting the Producer.

Equivalent recommended greases are as follows:

TYPE	PRODUCER
Sovarex L-O	MOBIL OIL
Gulfrown EP-O	GULF OIL
Alesia EP-2	SHELL OIL
Litholine Multi-Purpose	SINCLAIR
PGX-2 API	
Mariax 1	TEXACO
GR MUIEP2	AGIP
SPHEEROL EPL 2 SUPERGREASE 2	CASTROL

N.B. - The technical characteristics, the dimensions and all other data contained in this catalogue are not binding. CHIARAVALLI Trasmissioni spa reserves the right to change the measurements indicated at any time and without notice.

FRICTION TORQUE LIMITERS

The torque limiter is adopted where there is a need to provide efficient protection against overloads on mechanical parts (kinematic motions or machines). The easy-to-use and efficient device ensures complete operating reliability, the torque limiter device slips when the torque required exceeds the pre-set value and automatically restores the operating mode when the overload condition no longer applies.

The component selected from the pulleys, chain sprockets and gears is positioned between the friction discs, which develop a friction force generated by tightening the ring nut, anchored by compressing the cup springs.

Torque limiter selection:

T_{kw} = Power output expressed in kW n = r.p.m.

M_t = Twisting moment (Nm)

The twisting moment is given by the following relationship:

$$M_t = \frac{9550 \cdot T_{kw}}{n}$$

Example: Assuming a motor with the following characteristics is operated:

Power output 4 kW and $n = 1.550$ r.p.m.

$$M_t = \frac{9550 \cdot 4}{1550} = 24.64 \text{ Nm.}$$

We will therefore select a limiter with a torque value equal to or greater than 24.64 Nm.

N.B. We strongly recommend the LC range of limiters to be used dry, checking very carefully that greasy product or liquids in general do not come into contact with the friction materials to avoid a sudden and inevitable deterioration in performance. The driving bush is to be adjusted according to own requirements. **Friction discs are absolutely asbestos-free.**

CONDIZIONI GENERALI DI VENDITA

1) ORDERS - Orders for standard and special material shall always be referred to the quotations prepared by CHIARAVALLI Trasmissioni spa. Orders shall be deemed as binding for the Customer. Order cancellations or reductions shall not be accepted after order processing has been started, unless the Customer compensates the material and processing costs sustained up to the time the order is suspended. The quantity dispatched may vary by $\pm 5\%$ compared with the quantity ordered.

2) PRICES - Prices shall be understood as the prices in force at the date the order is placed. All prices refer to goods delivered ex-Premezzo, packing excluded. CHIARAVALLI Trasmissioni spa reserves the right to adjust prices to incorporate increases that have occurred, even for orders in progress, if the price increases for the material or other production costs become applicable during the supply period.

3) DELIVERY TERMS - Only delivery terms indicated by CHIARAVALLI Trasmissioni spa shall be deemed valid. However, delivery terms shall only be considered as indicative. Delivery terms shall be automatically deferred in cases of difficulty in procuring materials, of strikes or however in all circumstances of force majeure without CHIARAVALLI Trasmissioni spa being under an obligation to pay any form of indemnity. In any event the Customer shall be under obligation to collect special material ordered when the material in question becomes available.

4) SHIPMENTS - Shipments shall be understood to be the Customer's responsibility and be made at the Customer's risk, also in the case of shipments made on a carriage free basis. Claims concerning possible shortages shall be submitted within 8 days from the date the goods are received. CHIARAVALLI Trasmissioni spa reserves the right to select the most economic means of dispatch, if it has been agreed that the transport cost, even only in part, shall be borne thereby.

5) PACKING - Packing shall be invoiced at cost.

6) RETURNED GOODS - Returned goods shall not be accepted for any reason, unless previously authorised and with the packing, possible customs clearance operations and return costs being borne fully by the purchaser. A debit note amounting to 15% of the value of the returned goods shall be issued to cover warehousing and administrative costs.

7) WARRANTY - CHIARAVALLI Trasmissioni spa hereby undertakes to repair or replace free of charge parts that the Company acknowledges as faulty. The faulty goods shall be returned to CHIARAVALLI Trasmissioni spa Headquarters, with all costs paid.

The warranty shall be void if the returned parts have been repaired or tampered with. Repairs made by the Customer on faulty pieces shall only be acknowledged if authorised by CHIARAVALLI Trasmissioni spa and following approval of the repair estimate by the latter company.

CHIARAVALLI Trasmissioni spa shall not be held liable or pay indemnities of any kind for damages that occur during use of the Company's products, even if the products are faulty.

8) LIABILITY - CHIARAVALLI Trasmissioni spa shall not be held liable or pay indemnities of any kind for damages that occur during use of the Company's products, even if the products are faulty. CHIARAVALLI Trasmissioni spa declines all liability for the execution of parts made to the Customer's drawing, which may be subject to possible patents.

9) PAYMENTS - Only payments made in the forms and within the terms agreed shall be deemed valid. CHIARAVALLI Trasmissioni spa shall calculate arrears interest at the rate of 3% higher than the legal rate after the payment due date has elapsed, while maintaining the right to demand payment.

CHIARAVALLI Trasmissioni spa reserves the right to suspend deliveries of orders in progress or to demand payment in advance without granting the Customer any form of indemnity or compensation if the Customer delays payment or fails to effect payment.

Any claim concerning the materials in course of production or already delivered to the Customer shall not release the latter party from effecting payment at the agreed due date and for the full invoiced amount without any deduction being made.

10) OWNERSHIP - All goods dispatched shall remain the property of CHIARAVALLI Trasmissioni spa up to the time the relative invoices have been paid in full.

11) JURISDICTION - Any dispute regarding commercial relationships with CHIARAVALLI Trasmissioni spa shall be referred to the jurisdiction of the District of Court of Law of Busto Arsizio (VA).
