TECHNICAL CHARACTERISTICS

Motive motors are built according to international standard regulations; each size throughout the construction forms is calculated with reference to the tables of standard IEC 72-1.

Motive asynchronous three-phase Delphi series motors are closed, and externally ventilated.

The frame, up to 132 included, is made in die casting aluminium alloy, from size 160 up to 355 the frame is made in cast iron.

All motors are
multiple voltage
multi-frequency 50/60Hz,
F class insulation, (H on request)
S1 continuous duty service,
IP55 protection (IP56, 66, 67, and 68 on request)
1 or 2 efficiency class (CEMEP)
IE1, IE2 or IE3 efficiency class (IEC 60034-30)
tropicalized winding
suitable for inverter power supply

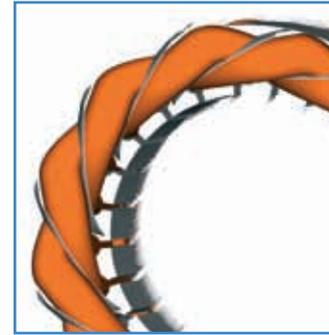

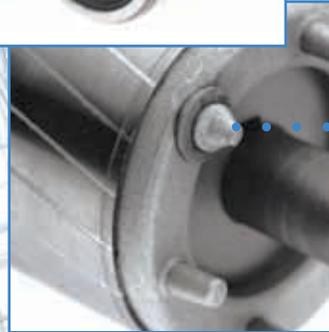

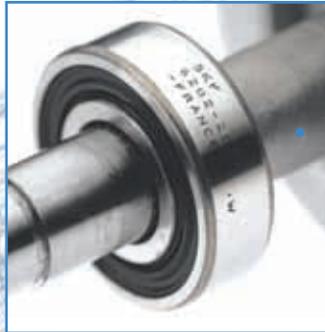

EFF 1

EFF 2

IE1, standard efficiency class IE 60034-30

IE2, high efficiency class IE 60034-30

IE3, premium efficiency class IE 60034-30

The copper is impregnated with a double layer of H class insulating enamel to ensure high resistance to electrical, thermal and mechanical stress.

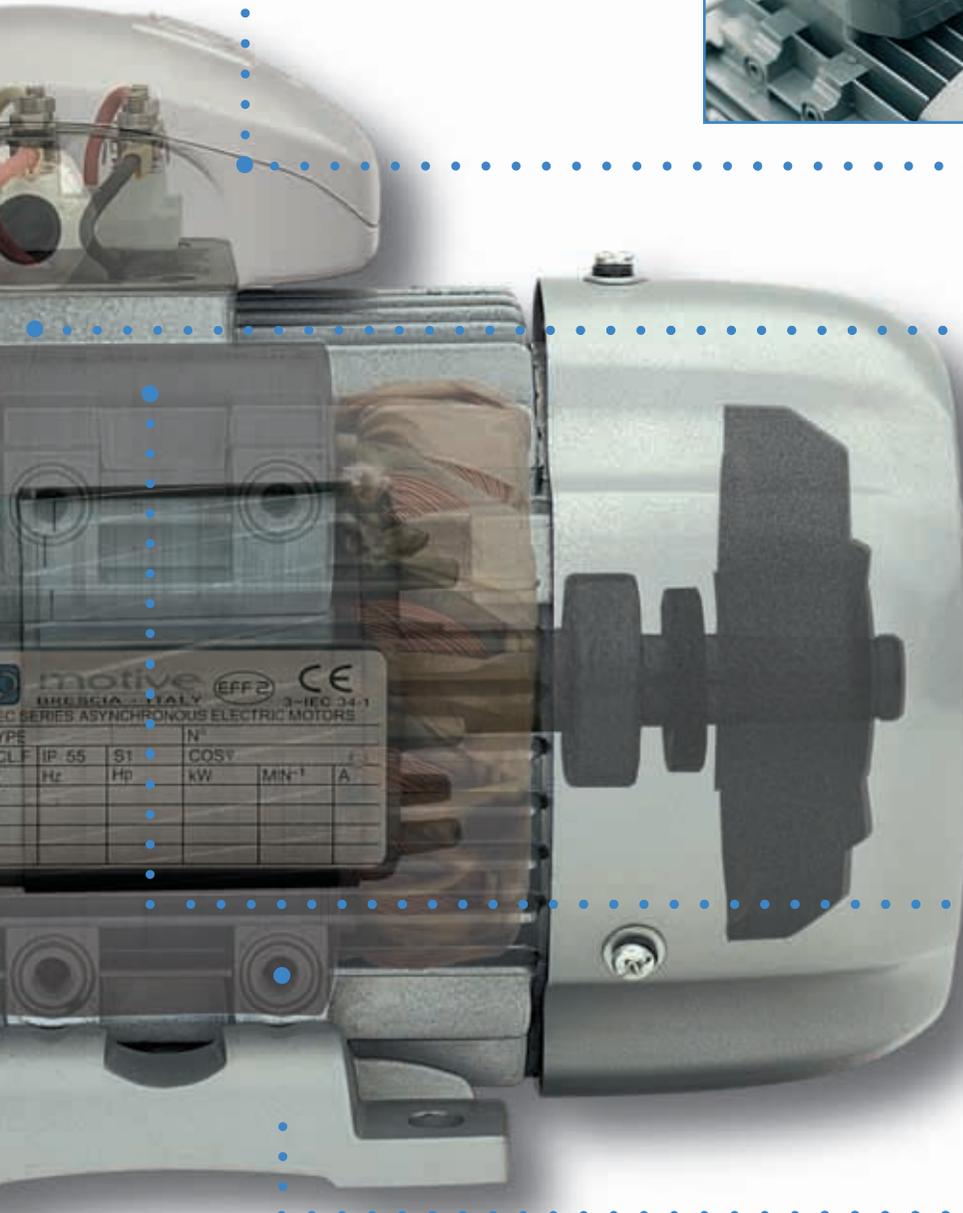

The phases are further isolated by another layer of Nomex film to protect the motors from the voltage peaks that usually occur when the motor is controlled by an inverter.

motive motors adopt only bearings selected for their silence and reliability and, for the same objectives, the cage rotor is dynamically balanced according to IEC 34-14 and ISO 9921 norms

From type 90, a steel insert is provided in the bearing slot of the aluminum flanges, to resist to radial mechanical forces with a fair degree of security

REGISTERED DESIGN

Aiming the maximum protection, the motors are equipped with important details like the pull-resistant cable press and the combination of bearings with two shields each with rubber seal rings

Cable press can be easily moved on both the sides of the connection box, thanks to the screw cap

the connection box can be rotated of 360° with steps of 90°

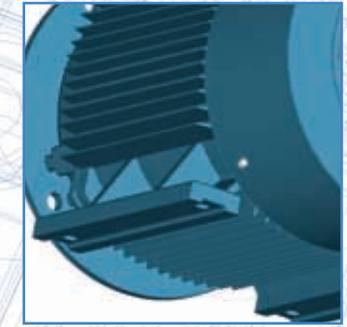

To protect them by the rust, motive motors are painted in silver RAL9006 colour

Performance excellence is granted by the low loss CRNO "FeV" magnetic laminations adoption, instead then the usual Semi Processed/Decarb "FePO1". FeV laminations provide higher efficiency, lower heating, energy saving and longer life to insulation materials

From size 160 and up, due to the high torque, the motors are fixed by feet that are die-casted with the iron frame

From size 56 to size 132, feet are detachable, and can be fixed on 3 sides of the housing, thus permitting the terminal box to be positioned up, right or left.

EFFICIENCY

Worldwide there are several classification systems of induction motors efficiencies. In order to create a common system, IEC (International Electrotechnical Commission) issued in October 2008 the norm IEC 60034-30 "Rotating electrical machines – Part 30: Efficiency classes of single-speed, three-phase, cage-induction motors (IE-code)". It's a classification system of efficiency that replaces the CEMEP one (to be clear, the one of "Eff. 1, Eff. 2, and Eff. 3" motors) and that, furthermore, recalls a new measuring and calculation way of efficiency, the one of the norm IEC 60034-2-1 (Rotating electrical machines – Part 2-1: Standard methods for determining losses and efficiency from tests), of September 2007.

In Europe it's a step ahead in the application of the Directive 2005/32/CE of 6 July 2005 "establishing a framework for the setting of ecodesign requirements for energy-using products".

It's based on such a normative picture and on the Regulation (EC) nr 640/2009 of 22 July 2009 that:

- From June 2011, the motors with efficiency lower than IE-2 will be forbidden
- From 2015, the minimum efficiency for motors from 7,5 to 375kW will be IE-3, and
- From 2017, the obligation of IE-3 will be extended to the motors from 0,75kW to 5,5kW

IEC classification and CEMEP classification

The following chart tries to synthesize a comparison between yesterday and today.

	world IEC 60034-30	Europe (50Hz) CEMEP	USA (60Hz) Epact	Further classification
IE-3 premium efficiency			Identical to NEMA Premium efficiency	AS in Australia NBR in Brasile BG/T in China IS in India JIS in Japan MEPS in Korea
IE-2 high efficiency		comparable to Eff. 1	Identical to NEMA energy efficiency/EPACT	
IE-1 standard efficiency		comparable to Eff. 2		

In our field, we list 5 main changes in Europe :

- The classification is now extended to 6 poles motors
- The powers range is wider
- In a direct comparison between Eff.2" and "IE-1" or between "Eff.1" and "IE-2" , we find that the first, the CEMEP values, are higher; but this is also a consequence of the
- Change in the measurement and calculation system of such values, that must now be made with the method of the new norm IEC 60034-2-1:2007, and
- Introduction of the IE3 "Premium efficiency" level.

Nevertheless, local legislations of some Countries inside and outside Europe, and the specific requirements of some associations, maintain often incentivized or even compulsory those motors called "Eff.1" according to the CEMEP system.

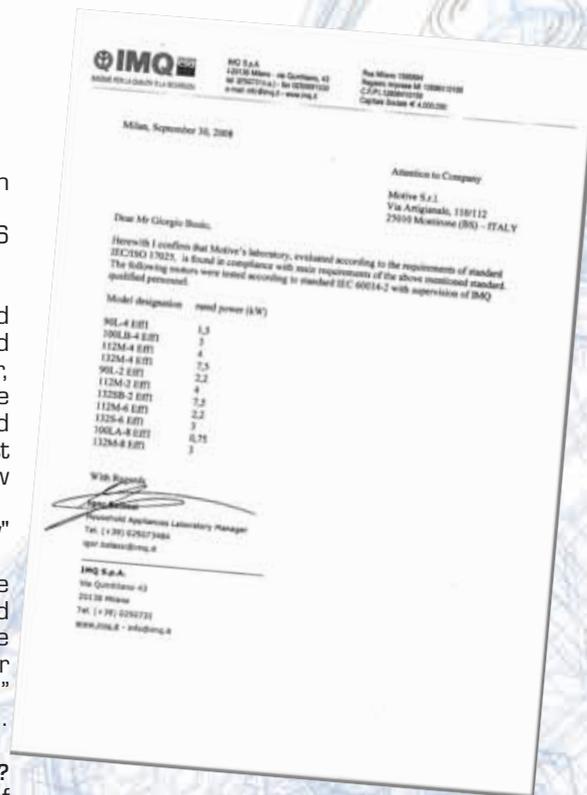

What does Motive do in this scenario?

- The measuring and calculation system of Motive motors efficiency is already conform to the norm 60034-2-1:2007. That's the one behind the data declared in the probative test-reports uploaded in motive web-site (each declared data, we remind it, is in fact supported, detailed and proven by such test reports)

- This, together with the fact that Eff.2 Motive motors are often offering an efficiency abundantly above the min allowed level, permits to several Eff.2 Motive motors to be already classifiable as IE-2 "high efficiency". Before 2011, anyway, all those motors that do not yet reach IE-2 efficiency level will be improved.

- "Eff.1" motors are already available, and most of them are already IE3 "premium efficiency".

- The test reports end data truth of Eff1 Motive motors has been certified by IMQ, the main Italian certification body for electrical appliances. The same, in fact, in September 2008 has firstly inspected

and qualified our internal laboratory according to the norm IEC/ISO17025, and then supervised the internal tests on a sampling list of Eff.1 motors, including some 6 and 8 poles in order to enclose further values that, out of CEMEP classifications, were already established by some Countries laws.

Clients benefits are of many kinds:

BILL EFFECTS

The purchase cost of a motor is about 2-3% of the total costs of its life. The balance is energy consumption costs. Comparing Eff.1 motors to Eff.2, the purchase price difference is recovered in about one year of energy saving. Of course, such period length depends by the specific motor, the use of it and the local energy costs of each Country. Motive can give you a tool in xls format to support you in this calculation.

DURABILITY EFFECTS

Higher efficiency motors heat less, slowing down the aging cycle of the insulating materials and living longer. Average operating life of Eff.2 motive motors is: 2500 hours/ year for motors up to 15kW 4000 hours/year for bigger motors. The average life is approximately from 25 to 30.000 hours for the first and 50,000 for the second ones. Eff.1 motors can live approx 40% longer than Eff.2 motors.

AMBIENT EFFECTS

Electric motors use 65% of all electricity in industry. Higher efficiency motors have the further objective of sustainable development, reduction of CO₂ emissions and consequent improvement of the quality of the atmosphere with an objective of sustainable development, Reduction of CO₂ emissions and consequent improvement of the quality of the atmosphere.

Motive motors are made with CRNO "FeV" magnetic lamination sheets, rather than the customary iron lamination sheets.

Further than raw material, the sheets thickness is another performance source . In fact, the thinner is the sheet, the higher are the performances.

The Semi Processed/Decarb lamination sheets "Fe PO1" can reach up to 1mm thickness.

FeV magnetic lamination sheets have a 0,5mm maximum thickness.

Composition and thickness give to magnetic lamination sheets a very low W/Kg loosing factor:

Lower specific losses mean less magnetising current for the same Power and torque (thus less heating).

Instead, no standard prescribes a maximum loosing factor for Fe PO1 lamination sheets; not even this data can be guaranteed. This is a source of potential performance diversities between motor and motor.

EURO NORM	W/ Kg a 1T	W/ Kg a 1,5T
106-84	1,70	4,00

data at 400V 50Hz

The main advantages given by the adoption of silicon magnetic laminations are: higher efficiency better guarantees on the quality consistency, assured by tolerances reported in international norms.

How to make a more efficient motor?

High efficiency can be seen in many ways: like the relation between output power and input absorbed power, or like a measure of the losses that born when converting the electric power in mechanical energy. From another perspective, high efficiency motors consume less energy to produce the same torque on the shaft. Basically, an high efficiency motor is the result of precise machining, lower frictions, a dynamically balanced rotor, smaller space between rotor and stator and of the use of better materials. The main factors for the design are based on the choice of the type of lamination sheets and windings with a greater turns number and a bigger diameter wire.

Among all materials that compose a motor, laminations have the highest influence on performance.

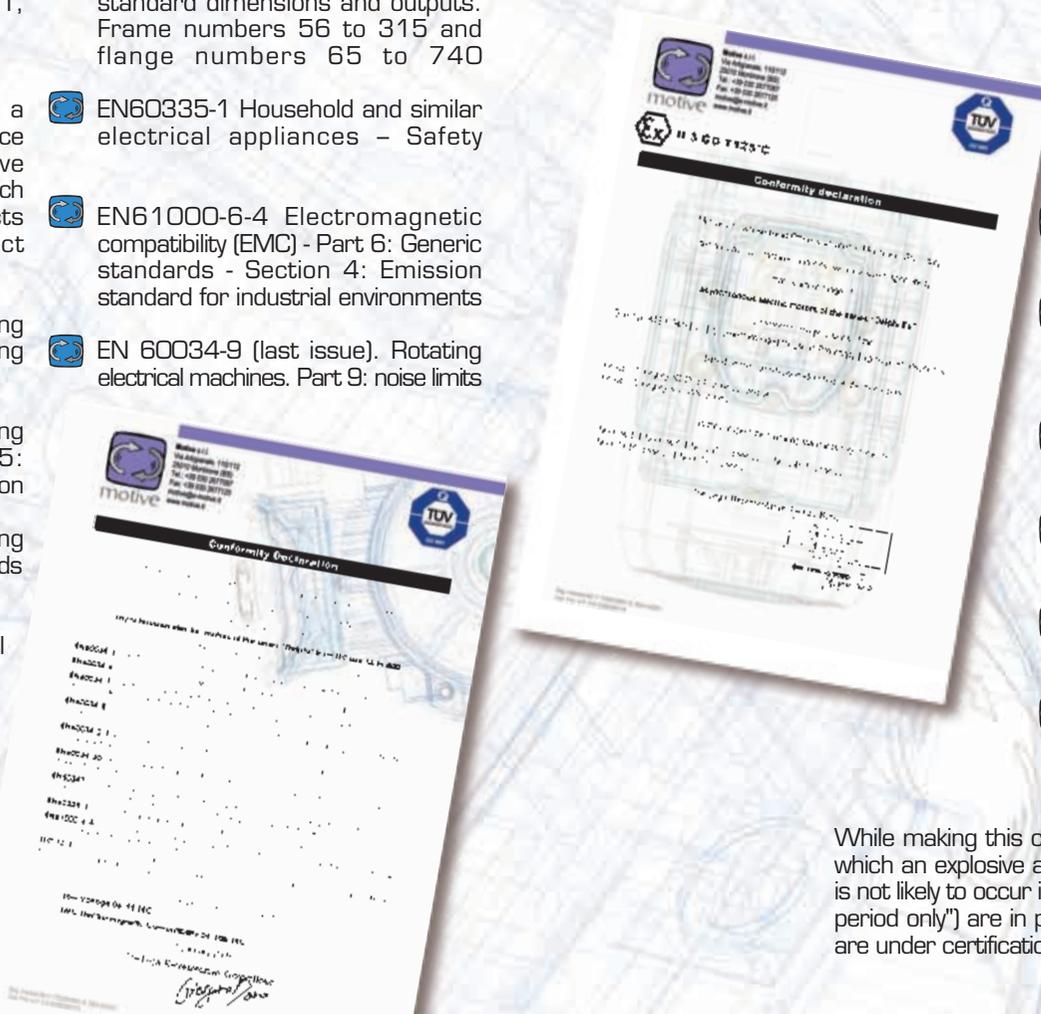

CE marking is referred to:

-  Low Voltage Directive (LVD) 2006/95/EC
-  Electromagnetic Compatibility Directive (EMC) 89/336 EC and its modifications 91/263 EC, 92/31 EC e 93/68 EC
- NB: The Machinery Directive (MD) 2006/42/EC excludes from its scope the electric motors (Art. 1, comma 2)
- CE marking is put by Motive as a visible sign of the product compliance with the requirements of above mentioned directives. In order to reach this conformity, Motive products respect the following product standards:
-  EN 60034-1 (last issue). Rotating electrical machines. Part 1: rating and performance
-  EN 60034-5 (last issue). Rotating electrical machines. Part 5: classification of degrees of protection
-  EN 60034-6 (last issue). Rotating electrical machines. Part 6: methods of cooling (IC code)
-  EN60034-7 Rotating Electrical Machines - Part 7: Classification of Types of Construction, Mounting Arrangements and Terminal Box Position (IM Code)
-  EN60034-8 Rotating electrical machines-Part 8: Terminal markings and direction of rotation
-  EN60034-2-1 (last issue). Rotating electrical machines. Standard methods for determining losses and efficiency from tests
-  EN60034-30 (last issue). Rotating electrical machines - Part 30: Efficiency classes of single-speed, three-phase, cage-induction motors
-  EN50347 General purpose three-phase induction motors having standard dimensions and outputs. Frame numbers 56 to 315 and flange numbers 65 to 740
-  EN60335-1 Household and similar electrical appliances – Safety
-  EN61000-6-4 Electromagnetic compatibility (EMC) - Part 6: Generic standards - Section 4: Emission standard for industrial environments
-  EN 60034-9 (last issue). Rotating electrical machines. Part 9: noise limits

ATEX is the conventional name of the Directive 94/9/EC for the equipment intended for use in potentially explosive atmospheres. The name comes from the words ATmosphères and EXplosibles. It became compulsory in all the European Union from 1st March 1996, imposing the evaluation of the risk for all the equipment operating in such environments. It classifies several levels of "danger" (zones): to every zone it corresponds a different typology of explosive atmosphere, according to its composition and to its probability and time of appearance. The client is responsible of the choice of the right motor based on the criteria described in the norm EN 61241-14.

Motive delphi Ex motors are designed to be used in the zone 22 (II 3 D T125°a1C) and/or zone 2 (II 3 G T125°a1C), according to the classification stated in the plate, and for the voltage and frequency field A described by the norm EN 60034 part 1 Cap. 6.3.

-  EN60079-0 Electrical apparatus for explosive gas atmospheres - Part 0: General requirements
-  EN60079-15 Electrical apparatus for explosive gas atmospheres - Part 15: Construction, test and marking of type of protection, "n" electrical apparatus
-  EN61241-0 Electrical apparatus for use in the presence of combustible dust - Part 0: General requirements
-  EN61241-1 Electrical apparatus for use in the presence of combustible dust - Part 1: Protection by enclosures "tD"
-  EN61241-14 Electrical apparatus for use in the presence of combustible dust - Part 14: Selection and installation
-  EN50281-2-1 Electrical apparatus for use in the presence of combustible dust. Test methods. Methods of determining minimum ignition temperatures

While making this catalogue, the motor "Delphi Ex", category 3 (for "a place in which an explosive atmosphere in the form of a cloud of combustible dust in air is not likely to occur in normal operation but if it does occur, will persist for a short period only") are in production, while the motors range "delphi Exd", category 2, are under certification.

PROTECTION TYPE

The protection against people accidental contacts and/or the entry of corps and/or the entry of water is expressed at international level (EN60529) by a symbolic acronym composed by a group of 2 letters and 2 numbers.

IP index of protection reference letters

1° num. Protection of people against contacts and protection against the entry of solid corps

2° num. Protection against harmful entry of water

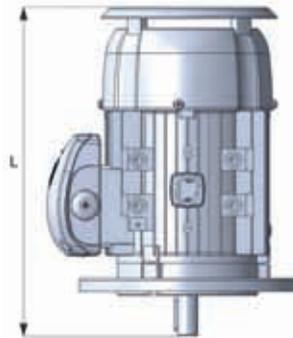

Motive motors are IP55 protected

	1° number	2° number
	0 no protection	no protection
	1 protection against solid corps bigger than 50mm	protection against vertical water drops
	2 protection against solid corps bigger than 12mm	protection against water drops fall up to 15° of inclination
	3 protection against solid corps bigger than a 2,5mm	protection against water drops up to 60° of inclination
	4 protection against solid corps bigger than 1 mm	protection against water sprayed by all directions
STANDARD	5 protection against harmful dust deposits	protection against water launched by a nozzle of 6,3mm D with a water capacity 12,5lt./min at a distance of maximum 3 mt for 3 min
OPTIONAL	6 complete protection against the total penetration of dust	protection against water projections similar to sea waves
OPTIONAL	7	protection from temporary submersion in water, up to 1 meter in depth
OPTIONAL	8	protection from extended periods of immersion, up to a specific depth

RAIN SHIELD OR CLEAN FLOW FAN COWL FOR TEXTILE INDUSTRY

For outdoor applications with V5 - V18 - V1 - V15 installation, we recommend to mount a rain shield. This configuration may also be used in textiles processing industry.

TOTAL SEALING

Resin coated stator is a safe solution to the presence of very strong humidity or aggressive environments (for instance, carwash systems or chemical plants). It offers also a lower heating thanks to the thermal dissipation capacity of the resin.

The ideal combination is the resin-filled terminal box. In this case, according to the customer needs, the terminal block can be partially immersed, or totally immersed in such insulating and protective resin. In alternative, the terminal box and block can be taken off and the motor frame be closed by a sealed plate from which a cable can come out.

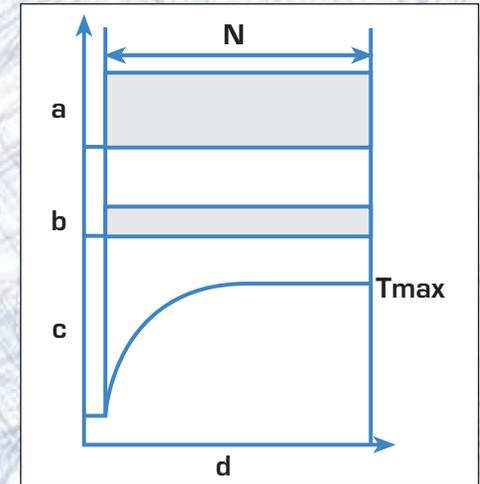

Note: rotors are painted against oxidation as a standard

DUTY SERVICE

All Motive motors shown in this catalogue are made for S1 continuous duty service, as per IEC 34-1 norm. The duty service class is shown on the rating plate.

Below are described the various types of service:

S1 - Continuous service: operating at constant load of duration N in order to reach a thermal balance.

- a = load
- b = electric losses
- c = temperature
- d = time
- N = steady load operating time
- Tmax = max temperature achieved

- S2 - Limited-duration service.
- S3 - Periodic intermittent service. S4 - Periodic intermittent service with start-up.
- S5 - Periodic intermittent service with electric braking.
- S6 - Uninterrupted periodic service with intermittent load.
- S7 - Uninterrupted periodic service with electric braking.
- S8 - Uninterrupted periodic service with correlated load and velocity variations.
- S9 - Service with non-periodic variations in load and speed.

WORKING CONDITIONS

HUMIDITY:

The electrical equipment must be able to work with a relative humidity between 30 and 95% (without condensation). Damaging effects of occasional condensation must be avoided by adequate equipment design or, if necessary, by additional measures (for example, Motive offers anti-condensation heaters, drain holes, resin coated stators, and resin filled terminal boxes).

ALTITUDE AND TEMPERATURE:

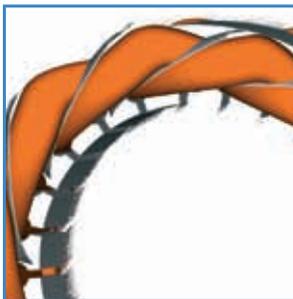

the powers indicated are intended for regular use at altitudes below 1000 mt above sea level and a room temperature between +5°C and +40°C for motors having a rated power below 0.6 kW, or between -15°C and 40°C for motors having a rated power equal to or greater than 0.6 kW (IEC 34-1): For working conditions rather than those specified (higher altitude and/or temperature) the power decreases of 10% each 10°C of higher temperature, and of 8% for each 1000 mt of higher altitude.

It is not necessary to reduce the rated power if at an altitude higher than 1000mt and lower than 2000mt there is a max ambient temperature of 30°C or, in altitudes from 2000 mt to 3000mt there is a max ambient temperature of 19°C.

VOLTAGE - FREQUENCY:

The admitted variation of supply voltage and frequency is established by the norm EN60034-1

Within this tolerance del phi motors provide the rated power reported in the plate.

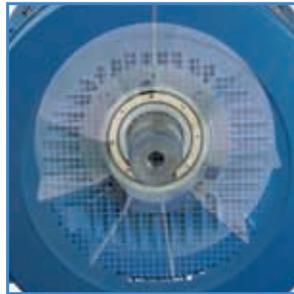

INSULATION:

The copper is impregnated with a double layer of H class insulating enamel to ensure high resistance to electrical, thermal and mechanical stress.

A NOMEX film that wraps entirely around the coil side insulates the copper and iron from one another.

The phases are further isolated by another layer of NOMEX to protect the motors from voltage peaks that usually occur when the motor is controlled by inverter.

In case that motors with more than 75 kW are controlled by inverter, we recommend to request the electrically insulated bearing on the non drive end.

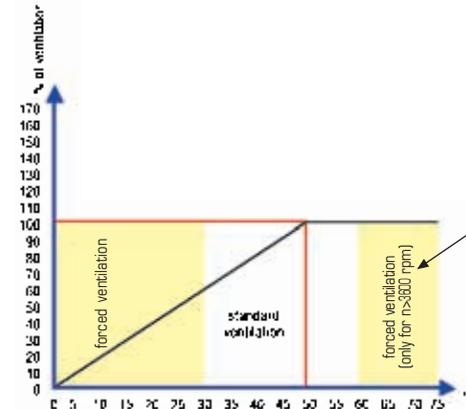

Its purpose is to open the electric circuit between the rotor and the motor frame, thus preventing that the shaft currents go through the bearings and damage their balls surface and roll tracks.

The section "technical data" of this catalogue shows the max operating temperatures according to the Class insulation shown on the plate.

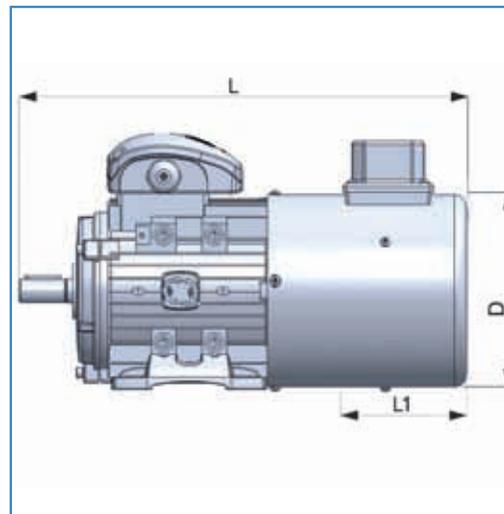

Delphi motors are designed to conserve wide margins against eventual overloads, having a temperature rise that is, at rated power, much lower than the operating temperature limit given by their insulation class. This fact increases considerably the motors life lenght. Such "ΔT" values are evidenced in the following performance charts. (see further details about temperature rise in the "technical data" section of this catalogue)

ASSISTED POWER COOLING

For application with a power supply at certain frequencies (see following graph), a power cooling system (IC-416) must be used.

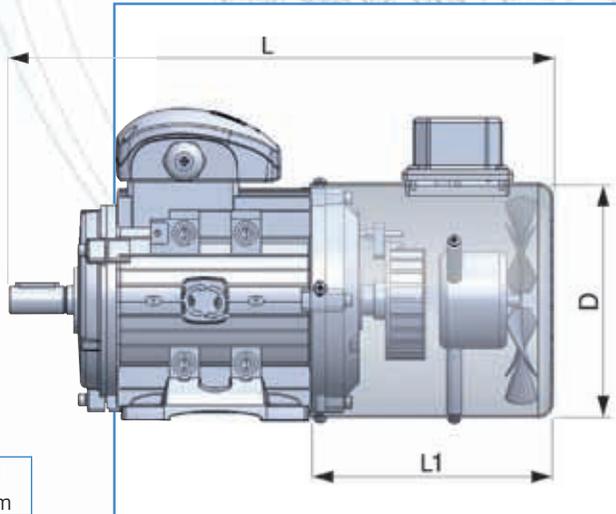

Motive power cooling systems are three-phase 400/50 400/60, IP 55, and with separate terminal box

MOTIVE MOTORS PROTECTION

protections must be chosen based on the specific running conditions, according to standards EN 60204-1.

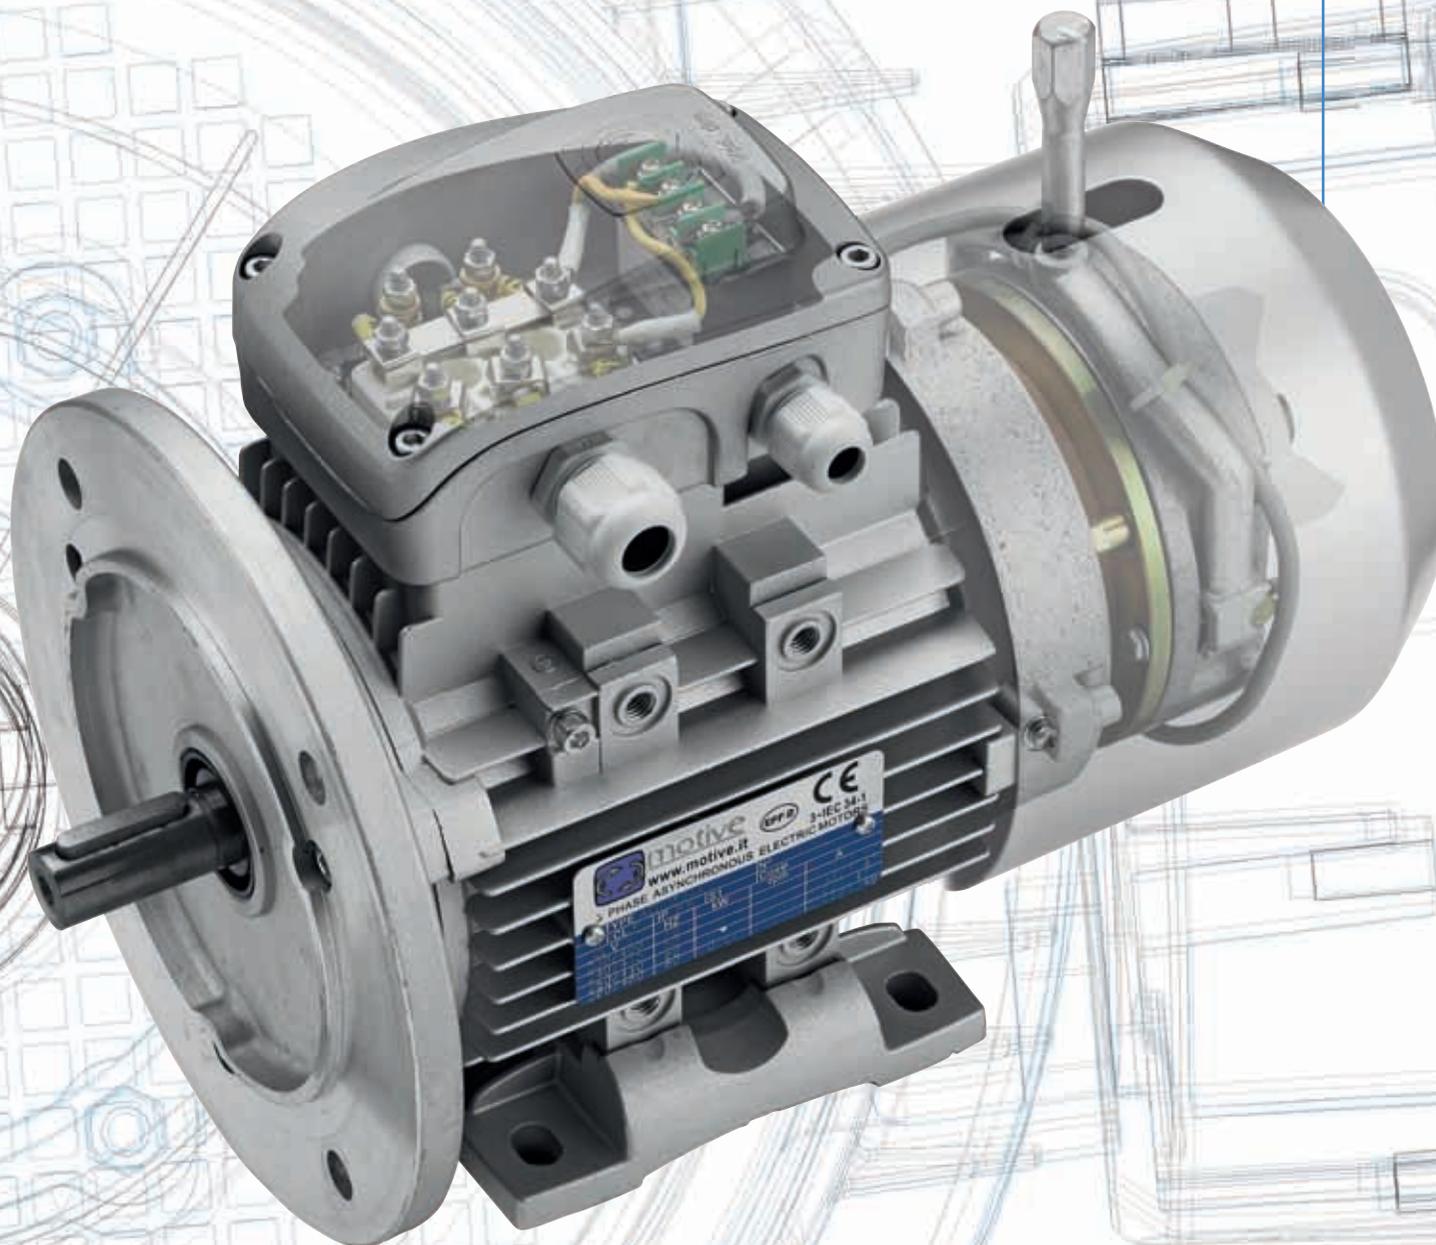

- Protection for motors with a shaft power greater than or equal to 0.5 kW with continuous S1 service. This protection may be achieved by means of a thermal cut-out relay, which automatically control a knife switch.
- Protection against peak currents by magnetic relay that controls an automatic knife switch, or by fuses; these must be set to the locked rotor current.
- If the application requires, protection against excessive speed of the electric motor, for example if the mechanical load may drive the electric motor itself and thereby create a hazardous situation.
- If special conditions or synchronised operation with other machines or parts of machines require it, protection against power failures or dips by means of a minimum voltage relay that controls an automatic power knife switch.

The electrical protections on the motor power line may not be sufficient to protect against overloads. If the cooling conditions worsen, the motor overheats but the electrical conditions do not change, which inhibits line protections. Installing built-in protections on the windings solves this problem:

- **PTO bimetallic device**
this is a normally-closed electromechanical device that opens electrically when the threshold temperature is reached; it automatically resets when the temperature falls below the threshold level. Bimetallic devices are available with various intervention temperatures and without automatic reset, per EN 60204-1.
- **PTC thermistor device**
this device promptly, positively adjusts its resistance once the threshold temperature is reached. Motive motors from type 160 to type 355L are equipped with 3 PTC thermistors in the winding, with temperature intervention of 150°C in Class F motors (standard), or 180°C in H Class motors.
- **PT100 device**
this is a device that continuously, increasingly adjusts its resistance according to the temperature. It is useful for constant measuring of the winding temperatures using electronic equipment.

THREE-PHASE SELF-BRAKING MOTORS SERIES DELPHI AT

DELPHI AT

Delphi ATDC, AT24, ATTD and ATTD24 series self-braking motors use one or 2 spring-pressure brakes, firmly spliced onto a cast iron shield at the back of the motor.

These motors include a series of characteristics normally considered options by other brands, like:
 -The standard hand lever permits to release the brake, making it possible to move manually the shaft,
 -The PTO thermal protectors in the winding are a standard up to size 132. PTC are a standard from size 160 and up

-Easy separate connection of the brake in case that the motor is connected to an inverter.

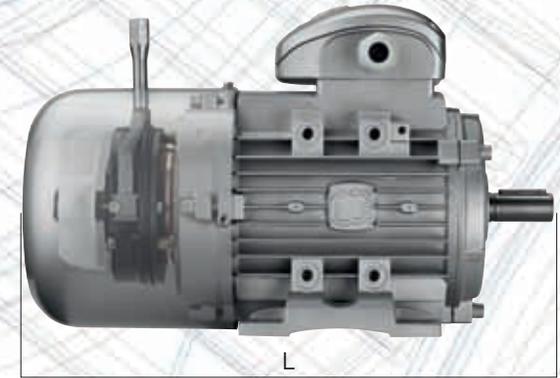

On ATDC and ATTD, the separate brake power supply is achieved, whenever needed, by connecting directly to the brake terminal board located inside the motor terminal box.

On AT24 and ATTD24, the 24Vdc single or double brakes are designed to be directly connected to an inverter (usually having a 24Vdc plug)

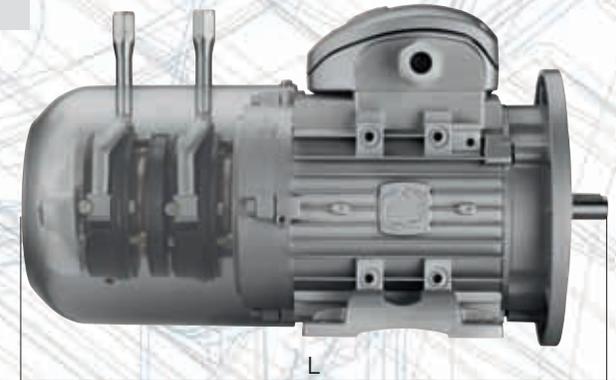

On request, the brakes can be modified to be extremely silent for usage in special environments like theatres

BRAKE DESCRIPTION

The Delphi AT... series brakes are electromagnetic brakes with negative operation, whose braking action is exercised in the absence of power supply. The brakes insulation class is F. The brakes lining is asbestos-free. The rectifier is of Mosfet type, with protection varistors at the entry and the exit. All brake assemblies are protected against corrosion by painting or heat galvanizing and resined winding. The parts most subject to wear are treated in special atmospheres that provide considerable wear resistance to the parts.

BRAKE OPERATION

When the power supply is interrupted, the excitation coil ⑦ is no longer powered and therefore doesn't exert the magnetic force necessary to restrain the mobile armature ①, which, pushed by the pressure springs ②, compresses the brake disc ③ against the motor flange ⑥ on one side and the armature itself on the other, thereby creating a braking action.

ADJUSTMENT

Two different types of adjustment are possible

S air gap adjustment

For proper operation, the air gap S between electromagnet ⑦ and the mobile armature ① must be between the following indicated limits:

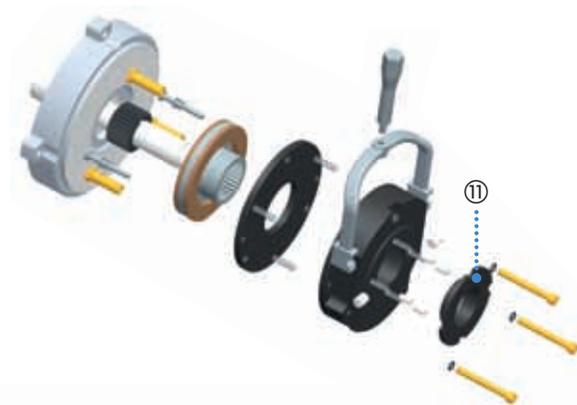

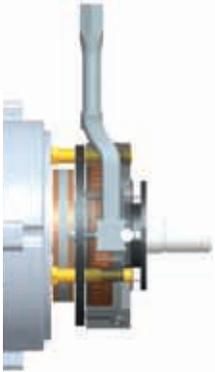

MOTOR TYPE	S AIR GAP (mm)
63-71	0.40-0.50
80-160	0.50-0.60

The adjustment is made by using the threaded bushes ⑩, using a thickness gauge to make sure that the wished air gap is reached.

Braking torque adjustment

The braking torque is set to its max level by Motive, but it can be decreased by acting on the adjuster screws ⑨ (ATDC and ATTD motors) or on the knob ⑪ (AT24 and ATTD24).

ATTD24

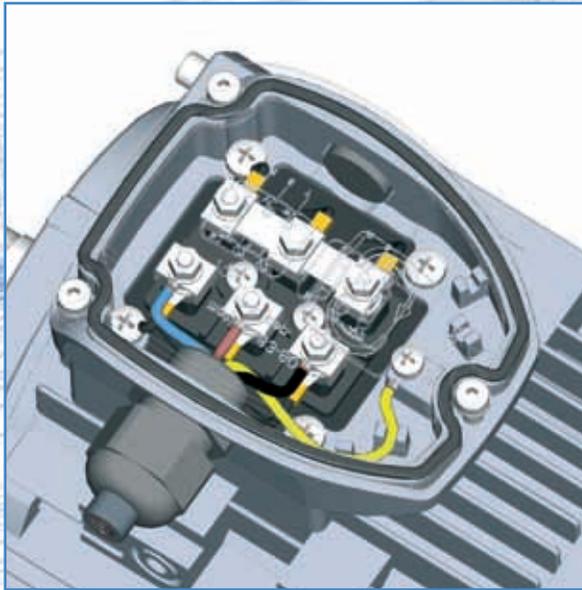

ATTD

WIRING DIAGRAMS

Motive three phase motors can be connected "Star" or "Delta".

STAR CONNECTION

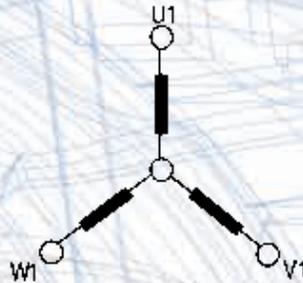

Star connection is obtained by connecting together the terminals W2, U2, V2 and supplying the terminals U1, V1, W1.

The phase current and voltage are respectively:

$$I_{ph} = I_n$$

$$U_{ph} = U_n / \sqrt{3}$$

where I_n is the supply line current and U_n is the supply line voltage of Star connection

the following voltages and frequencies are inside the standard power supply of all three-phase motive motors, under S1 duty service:

Size	Hz	Volts	
56-132	50 ±5%	230	400
		220	380
		240	415
	60 ±5%	260	440
		220	380
		265	460
132-355	50 ±5%	400	690
		380	660
		415	720
	60 ±5%	440	760
		380	660
		460	795
		480	830

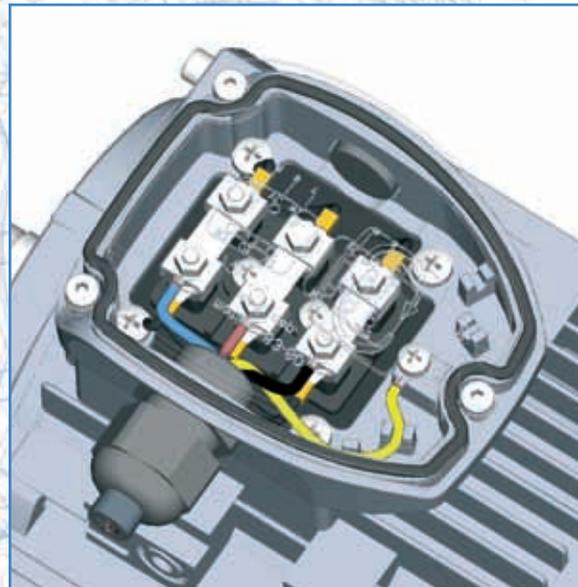

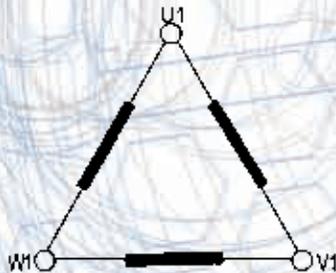

DELTA CONNECTION

Delta connection is obtained by connecting the end of a phase with the beginning of the following one. The phase current I_{ph} and the phase voltage U_{ph} are respectively:

$$I_{ph} = I_n / \sqrt{3}$$

$$U_{ph} = U_n$$

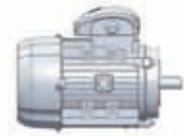

where I_n and U_n are referred to Delta connection.

TECHNICAL DATA

The general electrical specifications are listed in the performance charts that follow. To understand their contents, the following general definitions are provided.

Rated Power:
it is the mechanical power measured at the shaft expressed, according to the latest indications of international Standards Committees, in Watts or Kwatts. However, in the engineering sector it is still common to refer to power in terms of HP

Rated Voltage:
the voltage to be applied to the motor terminals in accordance with the specifications in the following tables

Frequency:
All electrical data in this catalogue refer to three-phase wound motors at 50 Hz. These may be connected to 60 Hz, taking into account the multiplier coefficients in the table below

Rated Current:
"In" is the Rated Current, expressed in Ampere, absorbed by the motor when supplied at Rated Voltage Vn (V) and giving the Rated Power Pn (W) and it is obtained by the formula

$$I_n = \frac{P_n}{\sqrt{3} \cdot V_n \cdot \eta \cdot \cos\varphi} \quad (\text{A})$$

In the following tables, the rated currents are referred to a Voltage supply of 400V. For other voltage supplies the absorbed rated current can be considered inversely proportional to the voltage supply.
EX:

Volt	230	380	400	440	690
In	1,74	1,05	1,0	0,91	0,64

Rated torque:
Cn is expressed in Nm, and it corresponds to the rated power and rated rpm. It is given by the multiplication of the force for the arm (distance) and it is measured in Nm because the force is expressed in Newton and the distance in metres. The rated torque value is obtained by the formula

$$C_n (\text{Nm}) = P_n \times 9550 / \text{rpm}$$

Pn= Rated power in KW
rpm= rated rotation speed

Efficiency:
 η is expressed in % and it is given by the relation between the output Power and the addition of output Power and the electric losses of the motor, that is the input power absorbed by the motor. The electric motors losses are mainly of two kinds: for joule effect (rotor and stator) and iron losses. The latest cause essentially heat. An higher efficiency means energy savings, lower heating, longer life of insulating materials.

The smaller a motor is, the more the presence of a double lip oil seal as the ones used on the drive end of Delphi flanged motors (B5 or B14) may affect, following the friction generated, performance. The motors B3 up to size 132, however, have V-rings with an almost non existent level of friction. For simplicity, the following performance tables indicate the levels of absorption and performance measured on B14 motors for size 56 and B3 motors for size 63 and above.

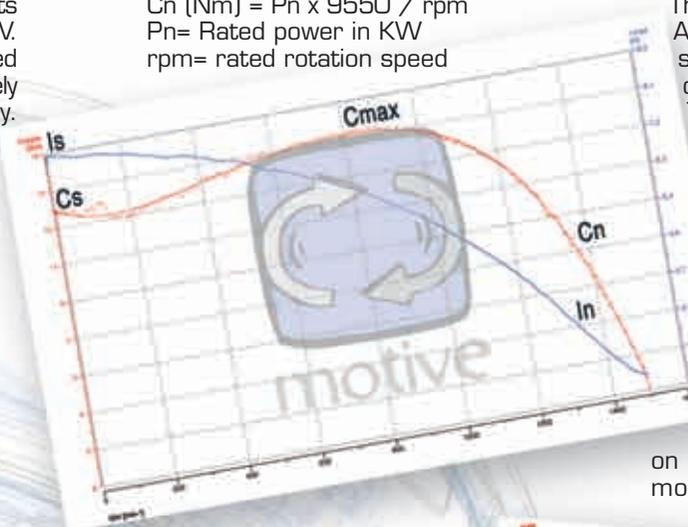

rated voltage at 50Hz	Volt at 60Hz	rated power W	In (A)	Cn (Nm)	rpm	Is (A)	Cs (Nm)	Cmax (Nm)
230 ± 10%	230 ± 5%	1	1	0,83	1,2	0,83	0,83	0,83
230 ± 10%	230 ± 10%	1	0,95	0,83	1,2	0,83	0,83	0,83

400 ± 10%	480 ± 5%	1,20	1	1	1,2	1	1	1

for further information, see chapter "wiring diagrams" at page 14

Synchronous speed:
is expressed in rpm and it is obtained by the formula
 $f = 120/p$
f= supply frequency Hz
p= number of poles pairs

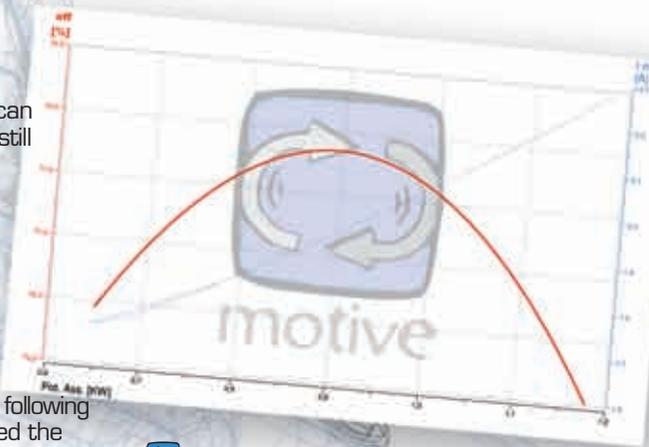

Motive motors can face also temporary overloads, with Current increases of 1.5 times the rated current for at least 2 minutes.

Starting current (or locked rotor current):
(you see diagram)

Starting torque (or locked rotor torque):
Cs is the torque that the motor can provide with the rotor at a standstill and the rated power supply.

Maximum torque:
Cmax is the maximum torque developed by the motor at the rated power supply, at a certain speed. It represents also the value of the resistant torque after which the motor stops. In the following performance charts, it is indicated the relation between maximum torque and rated torque and maximum torque

Power factor or cosφ:
it represents the coseno of the voltage and current gap angle.

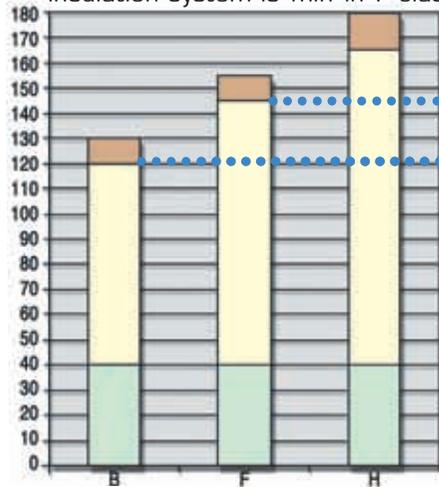

TECHNICAL DATA

temperature rise ΔT :

The temperature rise " ΔT " is the change in temperature of the entire winding of the motor, including the wire placed deep inside the stator slots, when it is being operated at full load.

For example: if a motor is located in a room with a temperature of 40°C, and then is started and operated continuously at the rated power, the winding temperature would rise from 40°C to a higher temperature. The difference between its starting temperature and the final inner elevated temperature, is the ΔT . Almost all our motors are designed to offer a temperature rise of B class or even lower, while their insulation system is min in F class.

Class	amb T (°C)	ΔT (°C)	hot spot allowance (°C)	Tmax (°C)
A	40	60	5	105
E	40	75	5	120
B	40	80	5	130
F	40	105	10	155
H	40	125	15	180

example of overload capability (=life bonus) of an F class motor, with B class temperature rise

This extra margin gives the motor a "life bonus". As a rule of thumb, insulation life will be doubled for each 10 degrees of unused insulation temperature capability. The most common method of measuring the temperature rise of a motor is based on the differences between the cold and hot ohmic resistance of the winding.

The formula is:

$$\Delta T [^{\circ}\text{C}] = (R2-R1)/R1 * (234,5+T1)-(T2-T1) \text{ Where:}$$

R1 = Cold winding resistance in Ohms (just before that the test begins)

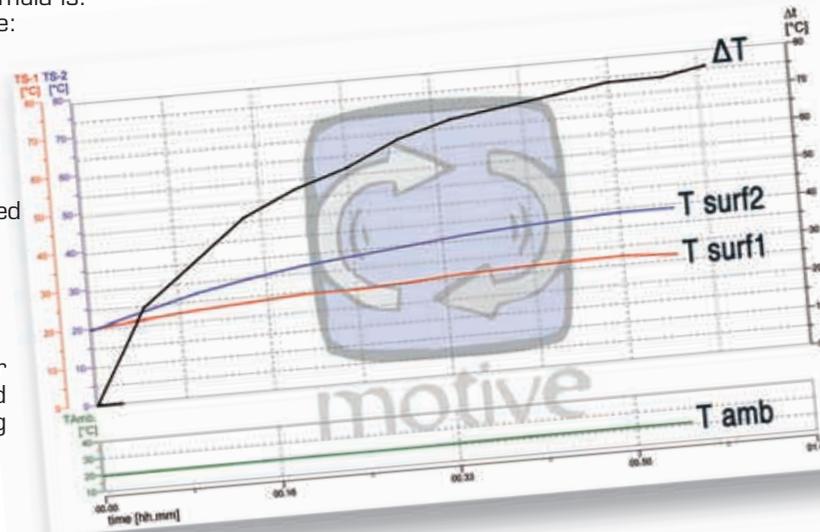

R2= Hot winding resistance in Ohms (when the motor has reached its thermal equilibrium)

T1= ambient temperature in °C when test begins

T2= ambient temperature in °C when test is stopped

To change ΔT from Centigrade to Fahrenheit:
°C (ΔT) x 1,8

Note: The motor surface temperature will never exceed the internal temperature of the motor, and will depend upon the design and cooling arrangements.

Noise:

The noise is expressed in dB(A). The measures must be taken in accordance with the standard ISO 1680-2, in order to find the Sound Power level LwA measured at 1m of distance from the perimeter of the machine.

EN 60034-9 standard describes the acoustic Power limits to be respected, indicating the maximum sound power level **LwA**. The noise values indicated in the performance charts that follow are referred to a no-load motor working, supplied at 50Hz and with a tolerance of +3 dB(A).

The moment of inertia can be calculated in this way:

$$J = (1/2) \times M \times (R^2)$$

Where M [Kg] is the rotation mass, while R [m] is the ray of the volume at cylindrical symmetry.

TOLERANCES

The data of each motor are specified in this catalogue like requested by the norm IEC 34-1. This describes, in particular, the following tolerances:

Efficiency (Output Power / input Power)	-15% di (1- η)
Power factor	1/ 6 of (1- $\cos\phi$) min. 0.02 max 0.07
Locked rotor torque	-15% of the guaranteed torque +25% of the guaranteed torque
Maximum torque	-10% -of the guaranteed torque, if torque is not less than 1,5- 1,6 the rated torque
Noise	+3dB
ΔT	+10°C

2 bearings lubrication devices on the front and the back shield are provided in motors from size 180 and up. Other motors mount staunch bearings pre-lubricated for life

"bearing lubrication devices" are an optional on motors size 56-160.

TERMS OF SALE AND GUARANTEE

ARTICLE 1 GARANTEE

1.1. Barring written agreements, entered into between the parties hereto each time, Motive hereby guarantees compliance of products supplied and compliance with specific agreements. The guarantee for defects shall be restricted to product defects following design, materials or manufacturing defects leading back to Motive.

The Guarantee shall not include:

-  faults or damages ensuing from transport., faults or damages ensuing from installation defects; incompetent use of the product, or any other unsuitable use.
-  tampering or damages ensuing from use by non - authorised staff and/or use of non - original parts and/or spare parts;
-  Defects and/or damages ensuing from chemical agents and/or atmospheric phenomena (e.g. burnt out material, etc.); routine maintenance and required action or checks;
-  Products lacking a plate or having a tampered plate.

1.2. Returns to credit or replace will be accepted only in exceptional cases; However returns of goods already used to credit or replace won't be accepted in any case.

The guarantee shall be effective for all Motive products, with a term of validity of 12 months, starting from the date of shipment.

The guarantee shall be subject to specific written request for Motive to take action, according to statements, as described at the paragraphs hereinbelow. By virtue of aforesaid approval, and as regards the claim, Motive shall be bound, at its discretion, and within a reasonable time-limit, to alternatively take the following action:

- a) To supply the Buyer with products of the same type and quality as those having proven defective and not complying with agreements, free ex-works; in aforesaid case, Motive shall have the right to request, at the Buyer's charge, early return of defective goods, which shall become Motive's property;
- b) To repair, at its charge, the defective product or to modify the product which does not comply with agreements, by performing aforesaid action at its facilities; in aforesaid cases, all costs regarding product transport shall be sustained by the Buyer.
- c) To send spare parts free of charge: all costs regarding product transport shall be sustained by the Buyer.

1.3 The guarantee herein shall assimilate and replace legal guarantees for defects and discrepancies, and shall exclude any other eventual Motive liability, however caused by supplied products; in particular, the Buyer shall have no right to submit any further claims.

Motive shall not be liable for the enforcement of any further claims, as of the date the guarantee's term of validity expires.

ARTICLE 2 CLAIMS

2.1. Without prejudice to the application of provisions in Law, dated June 21, 1971, and as per Article 1: Claims, regarding quantity, weight, gross weight and colour, or claims regarding faults and defects in quality or compliance, and which the Buyer may discover on goods delivery, shall be submitted by a max. 7 days of aforesaid discovery, under penalty of nullity.

ARTICLE 3 DELIVERY

3.1. Any liability for damages ensuing from total or partial delayed or failed delivery, shall be excluded.

3.2. Unless differently communicated by written to the Client, the transport terms have to be intended ex-works

ARTICLE 4 PAYMENT

4.1. Any delayed or irregular payments shall entitle Motive to cancel ongoing agreements, including agreements which do not regard the payments at issue, as well as entitling Motive to claim damages, if any. Motive shall, however, have the right, as of the payment's due date and without placing in arrears, to claim interest for arrears, to the extent of the discount rate in force in Italy, increased by 5 points. Motive shall also have the right to withhold material under repair for replacement. In the case of failed payment, Motive shall have the right to cancel all guarantees on materials, as regards the insolvent Client.

4.2. The Buyer shall be bound to complete payment, including cases whereby claims or disputes are underway.

ALL DATA HAVE BEEN WRITTEN AND CHECKED WITH THE GREATEST CARE. WE DO NOT TAKE ANY RESPONSIBILITY FOR POSSIBLE ERRORS OR OMISSIONS. MOTIVE CAN CHANGE THE CHARACTERISTICS OF THE SOLD ITEMS ON HIS FIRM OPINION AND IN EVERY MOMENT.
